NEW QUESTION: 3 A nuclear plant was the victim of a recent attack, and all the networks were air gapped. A subsequent investigation revealed a worm as the source of the issue. Which of the following BEST explains what happened?
A. The ICS firmware was outdated
B. A malicious USB was introduced by an unsuspecting employee.
C. A local machine has a RAT installed.
D. The HVAC was connected to the maintenance vendor.
Answer: B

NEW QUESTION: 4 Which of the following items is NOT primarily used to ensure integrity?
A. Cyclic Redundancy Check (CRC)
B. Redundant Array of Inexpensive Disks (RAID) system
C. Hashing Algorithms
D. The Biba Security model
Answer: B
Explanation: RAID systems are mostly concerned with availability and performance. All of the following were all concerned with integrity, only RAID was NOT mostly concerned with integrity.
Cyclic Redundancy Check: A cyclic redundancy check (CRC) is a type of function that takes as input a data stream of unlimited length and produces as output a value of a certain fixed size. The term CRC is often used to denote either the function or the function's output. A CRC can be used in the same way as a checksum to detect accidental alteration of data during transmission or storage. CRCs are popular because they are simple to implement in binary hardware, are easy to analyze mathematically, and are particularly good at detecting common errors caused by noise in transmission channels.
Hashing Algorithms: In cryptography, a cryptographic hash function is a hash function with certain additional security properties to make it suitable for use as a primitive in various information security applications, such as authentication and message integrity. A hash function takes a long string (or 'message') of any length as input and produces a fixed length string as output, sometimes termed a message digest or a digital fingerprint.
Enlarge Above you see a hash function at work. In various standards and applications, the two

most-commonly used hash functions are MD5 and SHA-1. In 2005, security flaws were identified in both algorithms. Many security professionals have started making use of SHA-256 and SHA-512 which are stronger hashing algorithms. The Biba Security Model: The Biba Integrity Model was developed to circumvent a weakness in the Bell-LaPadula computer operating system protection model which did not include the possibility of implicit deletion of security objects by writing to them. In general, preservation of integrity has three goals: Prevent data modification by unauthorized parties Prevent unauthorized data modification by authorized parties Maintain internal and external consistency (i.e. data reflects the real world) The Biba model address only the first goal of integrity. The Clark-Wilson model address all 3 goals listed above. References: <http://www.answers.com/topic/biba-integrity-model>
