NEW QUESTION: 2Which choice below denotes a packet-switched connectionless wide area network (WAN) technology?**A.** ATM**B.** X.25**C.** SMD**S.D.** Frame Relay**Answer: C****Explanation:** Switched Multimegabit Data Service (SMDS) is a high-speed, connectionless, packet-switching public network service that extends LAN-like performance to a metropolitan area network (MAN) or a wide area network (WAN). It's generally delivered over a SONET ring with a maximum effective service radius of around 30 miles.*X.25, defines an interface to the first commercially successful connection-oriented packet-switching network, in which the packets travel over virtual circuits.*Frame Relay, was a successor to X.25, and offers a connection-oriented packet-switching network.*Asynchronous Transfer Mode (ATM), was developed from an outgrowth of ISDN standards, and is fast-packet, connection-oriented, cell-switching technology.Source: Communications Systems and Networks by Ray Horak(M&T Books, 2000).

NEW QUESTION: 4Refer to the exhibit.The network is converged. [110/13] via 190.173.23.10, 00:00:07, FastEthernet 0/00 208.149.23.96 [110/13] via 190.173.23.10, 00:00:16, FastEthernet 0/0

Answer: D Explanation: Router_E learns two subnets 208.149.23.64 and 208.149.23.96 via Router_A through FastEthernet interface. The interface cost is calculated with the formula $108 / \text{Bandwidth}$. For FastEthernet it is $108 / 100 \text{ Mbps} = 108 / 100,000,000 = 1$. Therefore the cost is 12 (learned from Router_A) + 1 = 13 for both subnets - B is not correct. The cost through T1 link is much higher than through T3 link (T1 cost = $108 / 1.544 \text{ Mbps} = 64$; T3 cost = $108 / 45 \text{ Mbps} = 2$) so surely OSPF will choose the path through T3 link -> Router_E will choose the path from Router_A through FastEthernet 0/0, not Serial1/0 - C & D are not correct. In fact, we can quickly eliminate answers B, C and D because they contain at least one subnet learned from Serial1/0 - they are surely incorrect.
