**NEW QUESTION: 1** What is the purpose of Priority Delta in VRRP?  
**A.** When an Interface is up, Effective Priority = Priority + Priority Delta  
**B.** When a box up, Effective Priority = Priority + Priority Delta  
**C.** When a box fail, Effective Priority = Priority - Priority Delta  
**D.** When an Interface fail, Effective Priority = Priority - Priority Delta  
**Answer: D**  
**Explanation:** Explanation Each instance of VRRP running on a supported interface may monitor the link state of other interfaces. The monitored interfaces do not have to be running VRRP. If a monitored interface loses its link state, then VRRP will decrement its priority over a VRID by the specified delta value and then will send out a new VRRP HELLO packet. If the new effective priority is less than the priority a backup platform has, then the backup platform will begin to send out its own HELLO packet. Once the master sees this packet with a priority greater than its own, then it releases the VIP.

**NEW QUESTION: 2** A business sector is highly competitive, and safeguarding trade secrets and critical information is paramount. On a seasonal basis, an organization employs temporary hires and contractor personnel to accomplish its mission objectives. The temporary and contract personnel require access to network resources only when on the clock. Which of the following account management practices are the BEST ways to manage these accounts?  
**A.** Employ an account expiration strategy.  
**B.** Employ a password lockout policy  
**C.** Employ time-of-day restrictions.  
**D.** Employ a random key generator strategy.  
**E.** Employ password complexity.  
**Answer: A**

**NEW QUESTION: 3** **A.** Option C **B.** Option D **C.** Option B **D.** Option A  
**Answer: A,C,D**  
**Explanation:** Ways to create data blocks: 1. Data Load, (B) 2. Data Copy Command, (A) 3. Sparse Dimension Consolidation, 4. Member Formulas: 4a. Assigning a constant value to a sparse member, 4b. Turning Create Block on Equation setting on and assigning a non constant value (C) 4c. Create

non missing blocksB: The moment we load data to essbase, It creates block for those combinations automatically.C: Controls, within a calculation script, whether or not new blocks are created when a calculation formula assigns anything other than a constant to a member of a sparse dimension. SETCREATEBLOCKONEQ overrides the Create Block on Equation setting for the database.If calculations result in a value for a sparse dimension member for which no block exists, AnalyticServices creates a new block. Sometimes, the new blocks are not desired; for example, when they contain no other values. In large databases, creation and processing of unneeded blocks can increase processing time as well as the storage requirement for a database.For the situation when new blocks would be created as a result of assigning something other than a constant to a member of a sparse dimension, Analytic Services provides the Create Blocks on Equation setting. For example, when the Create Blocks on Equation setting is ON and West is assigned a value where it did not have a value before, new blocks are created. When this setting is OFF, new blocks are not created.Incorrect answer:Copy Data-Use to copy data from one part of your database to another. You select the source data to copy and specify the target or destination value.D: Aggregate data. There is no such specific command or utility. It is just a general concept in the Hyperion context.

**NEW QUESTION: 4**Select and Place:**Answer:** Explanation:Explanation:Box 1: Install Windows Server 2012 and SQL Server 2012 on physical machines.Box 2: Configure Server01 as a principal server and Server02 as a mirror server. Box 3: Configure Server03 as a log shipping destination. Note:\*From scenario:/ All servers must be virtualized unless otherwise specified. / The database servers must be physical machines running Windows Server 2012 with direct access to storage./ All database transaction logs must be sent off-site. (so we configure log shipping destination on Server3 which is located in New York while server1 and server2 are both in Chicago)./ The database servers must be configured for redundancy.\*SQL Server Log shipping allows you to automatically send transaction log backups from a primary database on a primary server instance to one or more secondary databases on separate secondary server instances.
