Or if you have other exam to attend, we can replace other 2 valid exam dumps to you, at the same time, you can get the update version for 220-1102 training materials.

Fastest Way To Get Through CompTIA 220-1102 Premium APP and PDF Exams Files, So you don't need to pay extra attention on the updating of study materials, What's more, if you need any after service help on our 220-1102 exam guide, our after service staffs will always offer the most thoughtful service for you.

In a matter of seconds, you will receive an assessment report based on each question you have practiced on our 220-1102 test material, And we have enough strength on this field.

Nobody wants troubles and difficulties, We are highly confident that you are going to pass 220-1102 exam on the first attempt using our 220-1102 practice questions dumps.

It is cost-effective, time-saving and high-performance for our users to clear exam with our 220-1102 cram PDF materials, However if you buy our 220-1102 exam engine, you just only need to spend [220-1102](#) 20-30 hours to practice training material and then you can feel secure to participate in this exam.

NEW QUESTION: 1The BEST methods for a web developer to prevent the website application code from being vulnerable to cross-site request forgery (XSRF) are to: (Select TWO).**A.** Validate and filter input on the server side and client side.**B.** Restrict and sanitize use of special characters in input and URLs.**C.** Permit redirection to Internet-facing web URLs.**D.** Ensure all HTML tags are enclosed in angle brackets, e.g., "<" and ">".**E.** Use a web proxy to pass website requests between the user and the application.**Answer: A,B**Explanation:XSRF or cross-site request forgery applies to web applications and is an attack that exploits the web application's trust of a user who known or is supposed to have been authenticated. This is often accomplished without the user's knowledge.XSRF can be prevented by adding a randomization string (called a nonce) to each URL request and session establishment and checking the client HTTP request header referrer for spoofing.

NEW QUESTION: 2Which of the following jobs is NOT affected by parallel processing?**A.** Replication job**B.** Backup copy job**C.** All of the above are affected by parallel processing**D.** Backup job**Answer: B**

NEW QUESTION: 3A company seized an employee's laptop due to illegal activity. The computer has been locked in an office until it can be turned over to authorities. and no one is allowed to log on to it Which of the following policies is this an example of?**A.** Chain of custody**B.** Proper reporting**C.** Data preservation**D.** PCI compliance**Answer: D**

NEW QUESTION: 4Your network contains a server that runs Windows Server 2008 R2. The server has the Web Server (IIS) role installed.The server has a Web application that uses HTTP. All authentication methods are enabledfor the Web application.You need to prevent passwords from being sent over the network in clear text.Which two authentication methods should you disable? (Each correct answer presents partof the solution. Choose two.)**A.** Forms**B.** Digest**C.** Anonymous**D.** Basic**E.** Windows Integrated**Answer: A,D**Explanation:Configure Basic Authentication (IIS 7) Basic authentication requires that users provide a valid user name and

password to access content. This authentication method does not require a specific browser, and all major browsers support it. Basic authentication also works across firewalls and proxy servers. For these reasons, it is a good choice when you want to restrict access to some, but not all, content on a server. However, the disadvantage of Basic authentication is that it transmits unencrypted base64encoded passwords across the network. You should use Basic authentication only when you know that the connection between the client and the server is secure. The connection should be established either over a dedicated line or by using Secure Sockets Layer (SSL) encryption and Transport Layer Security (TLS). For example, to use Basic authentication with Web Distributed Authoring and Versioning (WebDAV), you should configure SSL encryption.[http://technet.microsoft.com/en-us/library/cc772009\(WS.10\).aspx](http://technet.microsoft.com/en-us/library/cc772009(WS.10).aspx) Configuring Forms Authentication (IIS 7)Forms authentication uses client-side redirection to forward unauthenticated users to an HTML form where they can enter their credentials, which are usually a user name and password. After the credentials are validated, users are redirected to the page they originally requested. Because Forms authentication sends the user name and password to the Web server as plain text , you should use Secure Sockets Layer (SSL) encryption for the logon page and for all other pages in your application except the home page. [http://technet.microsoft.com/en-us/library/cc771077\(WS.10\).aspx](http://technet.microsoft.com/en-us/library/cc771077(WS.10).aspx) Check this link on MSDN for a nice comparison of all authentication methods:
