NEW QUESTION: 2 The amount of bone in the elderly skeleton - a key determinant in its susceptibility to fractures - is believed to be a function of two major factors. The first is the peak amount of bone mass attained, determined to a large extent by genetic inheritance. The marked effect of gender is obvious: Elderly men experience only one-half as many hip fractures per capita as elderly women. But also, African- American women have a lower incidence of osteoporotic fractures than Caucasian women. Other important variables include diet, exposure to sunlight, and physical activity. The second major factor is the rate of bone loss after peak bone mass has been attained. While many of the variables that affect peak bone mass also affect rates of bone loss, additional factors influencing bone loss include physiological stresses such as pregnancy and lactation. It is hormonal status, however, reflected primarily by estrogen and progesterone levels, that may exert the greatest effect on rates of decline in skeletal mass. The passage clearly identifies all of the following as factors in the rate of bone-mass loss EXCEPT for
A. lactation
B. progesterone levels
C. pregnancy
D. estrogen levels
E. sunlight exposure
Answer: E
Explanation: Explanation/Reference: Explanation: The passage mentions exposure to sunlight as one factor determining peak bone mass. Although the passage states that "many of the factors that affect the attainment of peak bone mass also affect rates of bone loss," the passage does not indicate that exposure to sunlight is one such factor.

NEW QUESTION: 3 Which of the following determines that the product developed meets the projects goals?
A. accuracy
B. concurrence
C. verification
D. validation
Answer: D
Explanation: Software Development Verification vs. Validation: Verification determines if the product

accurately represents and meets the design specifications given to the developers. A product can be developed that does not match the original specifications. This step ensures that the specifications are properly met and closely followed by the development team. Validation determines if the product provides the necessary solution intended real-world problem. It validates whether or not the final product is what the user expected in the first place and whether or not it solve the problem it intended to solve. In large projects, it is easy to lose sight of overall goal. This exercise ensures that the main goal of the project is met. From DITSCAP: 6.3.2. Phase 2, Verification. The Verification phase shall include activities to verify compliance of the system with previously agreed security requirements. For each life-cycle development activity, DoD Directive 5000.1 (reference (i)), there is a corresponding set of security activities, enclosure 3, that shall verify compliance with the security requirements and evaluate vulnerabilities. 6.3.3. Phase 3, Validation. The Validation phase shall include activities to evaluate the fully integrated system to validate system operation in a specified computing environment with an acceptable level of residual risk. Validation shall culminate in an approval to operate. NOTE: DIACAP has replace DITSCAP but the definition above are still valid and applicable for the purpose of the exam.
