NEW QUESTION: 4 In an Ethernet network, under what two scenarios can devices transmit? (Choose two.)
A. when the server grants access
B. when there is a carrier
C. when they receive a special token
D. when the medium is idle
E. when they detect no other devices are sending
Answer: D,E
Explanation: Ethernet network is a shared environment so all devices have the right to access to the medium. If more than one device transmits simultaneously, the signals collide and cannot reach the destination. If a device detects another device is sending, it will wait for a specified amount of time before attempting to transmit. When there is no traffic detected, a device will transmit its message. While this transmission is occurring, the device continues to listen for traffic or collisions on the LAN. After the message is sent, the device returns to its default listening mode.
