**NEW QUESTION: 1** PCI 준수를 위해 e-business 응용 프로그램을 설계하고 있습니다. 준수 요구 사항을 충족 시키려면 웹 응용 프로그램 로그를 모니터링하여 악의적인 활동을 식별해야 합니다. 또한 웹 인스턴스의 네트워크 인터페이스를 변경하려는 원격 시도를 모니터링해야 합니다. 이 목표를 달성하는데 도움이 되는 두가지 AWS 서비스는 무엇입니까?**A.** AWS CloudTrail 및 AWS 구성**B.** AWS CloudTrail 및 CloudWatch Logs**C.** AWS CloudTrail 및 VPC 흐름 로그**D.** Amazon CloudWatch Logs 및 VPC 흐름 로그**Answer: B**  
Explanation: Web application logs are internal to the operating system, so the only way to monitor them with an AWS service is to export them using CloudWatch Logs. AWS CloudTrail monitors the API activity and can be used to watch for particular API calls. The correct answer is the only one that references both these services.

**NEW QUESTION: 2** A Solutions Architect is designing a three-tier web application that includes an Auto Scaling group of Amazon EC2 Instances running behind an ELB Classic Load Balancer. The security team requires that all web servers must be accessible only through the Load Balancer and that none of the web servers are directly accessible from the Internet. How should the Architect meet these requirements?**A.** Use a Load Balancer installed on an Amazon EC2 instance**B.** Configure the web tier security group to allow only traffic from the ELB Classic Load Balancer**C.** Configure the web servers' security group to deny traffic from the public Internet**D.** Create an Amazon CloudFront distribution in front of the ELB Classic Load Balancer**Answer: D**  
Explanation: Routing Traffic to an ELB Load Balancer If you host a website on multiple Amazon EC2 instances, you can distribute traffic to your website across the instances by using an Elastic Load Balancing (ELB) load balancer. The ELB service automatically scales the load balancer as traffic to your website changes over time. The load balancer also can monitor the health of its registered instances and route domain traffic only to healthy instances. To route domain traffic to an ELB load balancer, use Amazon Route 53 to create an alias record that points to your load balancer. An alias record is a Route 53 extension to DNS. It's similar to a CNAME record, but you can create an alias record both for the root domain, such as example.com, and for subdomains, such as www.example.com. (You can create CNAME records only for subdomains.) Note Route 53 doesn't charge for alias queries to ELB load balancers or other AWS resources. Prerequisites Before you get started, you need the following: \* An ELB load balancer. You can use an ELB Classic, Application, or Network Load Balancer. For information about creating a load balancer, see Getting Started with Elastic Load Balancing in the Elastic Load Balancing User Guide Give the load balancer a name that will help you remember what it's for later. The name that you specify when you create a load balancer is the name that you'll choose when you create an alias record in the Route 53 console. \* A registered domain name. You can use Route 53 as your domain registrar, or you can use a different registrar. \* Route 53 as the DNS service for the domain. If you register your domain name by

using Route 53, we automatically configure Route 53 as the DNS service for the domain. For information about using Route 53 as the DNS service provider for your domain, see Making Amazon Route 53 the DNS Service for an Existing Domain.

**NEW QUESTION: 3** An administrator needs to change the default tenant name for vRealize Orchestrator. How can the administrator change the default tenant in vRealize Orchestrator Control Center? **A.** Configure the authentication provider. **B.** Modify the tenant name in the VAMI. **C.** Modify host settings. **D.** Configure system properties. **Answer: A**
