NEW QUESTION: 3Your company has a main office and a branch office. You discover that when you disable IPv4 on acomputer in the branch office, the computer authenticates by using a domain controller in the main office.You need to ensure that IPv6-only computers authenticate to domain controllers in the same site.What should you do?**A.** Install an Intra-Site Automatic Tunnel Addressing Protocol (ISATAP) router.**B.** Configure the NTDS Site Settings object.**C.** Create Active Directory subnet objects.**D.** Create Active Directory Domain Services connection objects.**Answer: C****Explanation:**IPv4 was disabled on the computer, forcing it to use IPv6 only. Because it authenticated against a domain controller in the main office, however, we can conclude that the branch office isn't completely setup for IPv6 yet. So we would have to use subnet objects in AD to force each office to authenticate against local site DC's.ISATAP tunnels IPv6 traffic over IPv4 networks, but the main office network clearly handles IPv6 fine.NTDS Site Settings and AD connection objects are used for configuring AD replication and topology.
