in Control Panel Network and Internet Network Connections so if a virtual machine needs contact outside the host machine this one is a must. Internal - This virtual switch can be used to connect all virtual machines and the host machine but cannot go outside that. Private - This virtual switch can only be used by the virtual host. External will allow communication with the host machine but also allow access to other machines on the host machine's network which is not a requirement.

NEW QUESTION: 4 After adding a remote CIFS share to /etc/fstab, the share is mounted to the correct place in the file system. There, all files belong to the user and group root and are not read- or writable to any other users in the system. What should be done in order to permit a distinct local user access to the mounted files?
A. The user should be added to the local user group smbusers as mount.cifs by default restricts access to all CIFS mounts to members of this group in addition to the root account.
B. The mount.cifs command must always be executed by the user who should use the mount afterwards. The user should be granted the required permission in /etc/sudoers.
C. The mount.cifs options uid, gid, file_mode and dir_mode should be used to specify the ownership and permissions of the mount.
D. The option root squash = yes should be added to the share in the Samba servers smb.conf to allow full access by the client.
