**NEW QUESTION: 1**Your network contains an Active Directory domain. The domain contains two organizational units (OUs) named ProdOU and TestOU. All production servers are in ProdOU. All test servers are in TestOU. A server named Server1 is in TestOU. You have a Windows Server Update Services (WSUS) server named WSUS1 that runs Windows Server 2016. All servers receive updates from WSUS1. WSUS is configured to approve updates for computers in the Test computer group automatically. Manual approval is required for updates to the computers in the Production computer group. You move Server1 to ProdOU, and you discover that updates continue to be approved and installed automatically on Server1. You need to ensure that all the servers in ProdOU only receive updates that are approved manually. What should you do?  
**A.** Create computer groups by using the Update Services console.  
**B.** Run wuauclt.exe /detectnow on each server after the server is moved to a different OU.  
**C.** Turn off auto-restart for updates during active hours by using Group Policy objects (GPOs).  
**D.** Configure client-side targeting by using Group Policy objects (GPOs).  
**Answer: D**  
**Explanation:** Updates in WSUS are approved against "Computer Group", not AD OUs. For this example, to prevent Server1 to install automatically approved updates, on "Test" computer group and add Server1 into "Production" computer group in WSUS console, manually or use the WSUS GPO Client-Side Targeting feature.

<https://technet.microsoft.com/en-us/library/cc720450%28v=ws.10%29.aspx?f=255&MSPPError=-2147217396> With client-side targeting, you enable client-computers to add themselves to the computer groups you create in the WSUS console. You can enable client-side targeting through Group Policy (in an Active Directory network environment) or by (in a non-Active Directory network environment) for the client computers. When the WSUS client computers connect to the WSUS server, they will add themselves into the correct computer group. Client-side targeting is an excellent option if you have many client computers and want to automate the process of assigning them to computer groups. First, configure WSUS to allow Client Site Targeting. Secondly, configure GPO to affect "ProdOU", so that Server1 add itself to

"Production" computer group.

**NEW QUESTION: 2** You are troubleshooting the failure of a computer to mount an NFS file system hosted by a server (hostname mars) in the local area network. Select the three commands that will enable you to identify the problem. **A.** `rpcinfo -s mars | egrep 'nfs|mountd'` **B.** `cat /etc/dfs/dfstab` **C.** `cat /etc/vfstab` **D.** `showmount -e mars` **E.** `sharemgr show -v` **F.** `ping -s mars`  
**Answer: A,D,F**  
**Explanation:** Explanation/Reference: mount: mount-point /DS9 does not exist. To solve the mount point error condition, check that the mount point exists on the client. Check the spelling of the mount point on the command line or in the /etc/vfstab file (B) on the client, or comment out the entry and reboot the system. Note: The /etc/vfstab file lists all the file systems to be automatically mounted at system boot time, with the exception of the /etc/mnttab and /var/run file systems. E: showmount This command displays all clients that have remotely mounted file systems that are shared from an NFS server, or only the file systems that are mounted by clients, or the shared file systems with the client access information. The command syntax is: showmount [ -ade ] [ hostname ] where -a prints a list of all the remote mounts (each entry includes the client name and the directory), -d prints a list of the directories that are remotely mounted by clients, -e prints a list of the files shared (or exported), and hostname selects the NFS server to gather the information from. If hostname is not specified the local host is queried. F: \* mountd Daemon This daemon handles file-system mount requests from remote systems and provides access control. The mountd daemon checks /etc/dfs/sharetab to determine which file systems are available for remote mounting and which systems are allowed to do the remote mounting. \* Commands for Troubleshooting NFS Problems These commands can be useful when troubleshooting NFS problems. rpcinfo Command This command generates information about the RPC service that is running on a system. Incorrect answers: A: not a network connectivity problem D: The sharemgr command configures share groups and the shares contained within them. Reference: man showmount
