NEW QUESTION: 2 会社のローカル環境は、単一のActive Directoryドメインサービス (AD DS) ドメインで構成されています。Azure Active Directory (Azure AD) 認証を使用するAzureでホストされるサービスとしてのソフトウェア (SaaS) アプリケーションへのシングルサインオン (SSO) アクセスをユーザーに提供する予定です。テナントの現在のドメイン名はcompanycom.onmicrosoft.comです。Azure ADを構成して、組織が所有するパブリックドメイン名であるcompany.comを使用する必要があります。あなたは何をすべきか?
A. Azure ADテナントからcompanycom.onmicrosoft.comドメイン名を削除します。
B. ドメインレジストラでDNS検証レコードを追加します。
C. company.comのユーザープリンシパル名 (UPN) サフィックスをAD DSドメインに追加します。
D. ドメインメンバーサーバーからAzure AD Connectを実行し、カスタムインストールオプションを指定します。
Answer: B
Explanation: You should add a Domain Name System (DNS) verification record at the domain registrar. This step is required to verify to Microsoft that you own the public DNS domain name in question. You perform the validation by creating either a text (TXT) or mail exchanger (MX) record in your DNS zone file at the registrar's website, using Microsoft-provided values. You can delete the verification record after Azure validates the domain for use with Azure AD. You should not remove the companycom.onmicrosoft.com domain name from the Azure AD tenant. In fact, you cannot remove this domain name because Azure uses it to identify your directory uniquely across the entire Microsoft Azure global ecosystem. You should not add a company.com user principal name (UPN) suffix to the AD DS domain. If you use a non-routable DNS domain in AD DS, then you may indeed be required to perform this action. However, the scenario does not specify what AD DS domain name is currently defined. You should not run Azure AD Connect from a domain member server and specify the custom installation option. Configuring the proper public and private DNS domain names is one of the prerequisite steps that needs to be completed before you run the Azure AD Connect wizard for the first time.

NEW QUESTION: 3 Which of the following formulae describes Marginal VaR for a portfolio p , where V_i is the value of the i -th asset in the portfolio? (All other notation and symbols have their usual meaning.)
A) $B) C) D) All of the above$
A. Option D
B. Option B
C. Option C
D. Option A
Answer: A
Explanation: Marginal VaR of a component of a portfolio is the change in the portfolio VaR from a \$1 change in the value of the component. It helps a risk analyst who may be trying to identify the best way to influence VaR by changing the components of the

portfolio. Marginal VaR is also important for calculating component VaR (for VaR disaggregation), as component VaR is equal to the marginal VaR multiplied by the value of the component in the portfolio. Marginal VaR is by definition the derivative of the portfolio value with respect to the component i . This is reflected in Choice 'a' above. Using the definitions and relationships between correlation, covariance, beta and volatility of the portfolio and/or the component, we can show that the other two choices are also equivalent to Choice 'a'. Therefore all the choices present are correct.
