NEW QUESTION: 2An administrator is setting up a new host in a redundant fabric environment with a storage array capable of sustaining active/active connections. Which of the following is the minimal number of single-port HBAs and which feature should the administrator use?**A.** 4 using LVMB. 4 using VTLC. 6 using LVMD. 2 using MPIO**Answer: D**

NEW QUESTION: 3Sara, a hacker, is completing a website form to request a free coupon. The site has a field that limits the request to 3 or fewer coupons. While submitting the form, Sara runs an application on her machine to intercept the HTTP POST command and change the field from 3 coupons to 30.Which of the following was used to perform this attack?**A.** Proxy**B.** SQL injection**C.** Packet sniffer**D.** XML injection**Answer: D**
Explanation:When a web user takes advantage of a weakness with SQL by entering values that they should not, it is known as aSQL injection attack. Similarly, when the user enters values that query XML (known as XPath) with values that take advantage of exploits, it is known as an XML injection attack. XPath works in a similar manner to SQL, except that it does not have the same levels of access control, and

taking advantage of weaknesses within can return entire documents. The best way to prevent XML injection attacks is to filter the user's input and sanitize it to make certain that it does not cause XPath to return more data than it should. Incorrect Answers: A. SQL injection is a code injection technique, used to attack data-driven applications, in which malicious SQL statements are inserted into an entry field for execution (e.g. to dump the database contents to the attacker). SQL injection must exploit a security vulnerability in an application's software, for example, when user input is either incorrectly filtered for string literal escape characters embedded in SQL statements or user input is not strongly typed and unexpectedly executed. SQL injection is mostly known as an attack vector for websites but can be used to attack any type of SQL database. Being a web based form, it is more likely that XML was used rather than SQL. C. Packet sniffing is the process of intercepting data as it is transmitted over a network. A sniffer (packet sniffer) is a tool that intercepts data flowing in a network. If computers are connected to a local area network that is not filtered or switched, the traffic can be broadcast to all computers contained in the same segment. This doesn't generally occur, since computers are generally told to ignore all the comings and goings of traffic from other computers. However, in the case of a sniffer, all traffic is shared when the sniffer software commands the Network Interface Card (NIC) to stop ignoring the traffic. Packet sniffing is not used for modifying data; it only reads it. Therefore this answer is incorrect. D. A proxy server is often used to filter web traffic. It is not used to modify the content of HTTP POST commands. Therefore this answer is incorrect. NEW QUESTION: 4 You develop a webpage by using HTML5. The user interface of the webpage must show a gray-lined box that contains the label Enter your information:. Inside the box are two labels and two input boxes. The first input box must be labeled Name:. The second input box must be labeled Email:. Below the box is a Submit button. The user interface must look like the following; You need to create the user interface. Which markup should you use? **A.** Option D **B.** Option B **C.** Option C **D.** Option A **Answer: B** Explanation: * The <fieldset> tag is used to group related elements in a form. The <fieldset> tag draws a box around the related elements. The <legend> tag defines a caption for the <fieldset> element. Example: Group related elements in a form: <form><fieldset><legend>Personalia:</legend>Name: <input type="text">
Email: <input type="text">
Date of birth: <input type="text"></fieldset></form> Reference: HTML <fieldset> Tag; HTML <legend> Tag
