NEW QUESTION: 1 Refer to the exhibit. Which syslog facility option is shown?
A. the Cisco WLC identifier for this syslog server
B. the type of syslog server
C. a security feature, which is set on the syslog server
D. an information field, which is added to every message that comes from the WLC
Answer: D
Explanation: Explanation/Reference: Explanation: A facility level is used to specify what type of program is logging a message. This lets the configuration file specify that messages from different facilities will be handled differently. Local7 maps to Facility level 23, which is local so the WLC will add this information to syslog messages when sending to the syslog server.

NEW QUESTION: 4 Which of the following statements pertaining to block ciphers is incorrect?
A. Plain text is encrypted with a public key and decrypted with a private key.
B. It is more suitable for software than hardware implementations.
C. Some Block ciphers can operate internally as a stream.
D. It operates on fixed-size blocks of plaintext.
Answer: A
Explanation: Block ciphers do not use public cryptography (private and public keys). Block ciphers is a type of symmetric-key encryption algorithm that transforms a fixed-size block of plaintext (unencrypted text) data into a block of ciphertext (encrypted text) data of the same length. They are appropriate for software implementations and can operate internally as a stream. See more info below about DES in Output Feedback Mode (OFB), which makes use internally of a stream cipher. The output feedback (OFB) mode makes a block cipher into a synchronous stream cipher. It generates keystream blocks, which are then XORed with the plaintext blocks to get the ciphertext. Just as with other stream ciphers, flipping a bit in the ciphertext produces a flipped bit in the plaintext at the same location. This property allows many error correcting codes to function normally even when applied before encryption.
