Answer: B,DExplanation:ExplanationClaims in access tokensJWTs (JSON Web Tokens) are split into three pieces:* Header - Provides information about how to validate the token including information about the type of token and how it was signed.* Payload - Contains all of the important data about the user or app that is attempting to call your service.* Signature - Is the raw material used to validate the token.Your client can get an access token from either the v1.0 endpoint or the v2.0 endpoint using a variety of protocols.Scenario: User authentication (see step 5 below)The following steps detail the user authentication process:* The user selects Sign in in the website.* The browser redirects the user to the Azure Active Directory (Azure AD) sign in page.* The user signs in.* Azure AD redirects the user's session back to the web application. The URL includes an access token.* The web application calls an API and includes the access token in the authentication header. The application ID is sent as the audience ('aud') claim in the access token.* The back-end API validates the access token.Reference:
