**NEW QUESTION: 1**An IS auditor is reviewing an IT security risk management program. Measures of security risk should:**A.** result in the identification of vulnerability tolerances.**B.** address all of the network risks.**C.** be tracked over time against the IT strategic plan.**D.** take into account the entire IT environment.**Answer: D****Explanation:**When assessing IT security risk, it is important to take into account the entire IT environment. Measures of security risk should focus on those areas with the highest criticality so as to achieve maximum risk reduction at the lowest possible cost. IT strategic plans are not granular enough to provide appropriate measures. Objective metrics must be tracked over time against measurable goals, thus the management of risk is enhanced by comparing today's results against last week, last month, last quarter. Risk measures will profile assets on a network to objectively measure vulnerability risk. They do not identify tolerances.

**NEW QUESTION: 2**Refer to Scenario 7.-- Exhibit -Scenario 7.A web hosting company has been growing steadily over the past year. Their single data center is at maximum capacity for power, space and cooling, and their physical infrastructure is also running at capacity. They are evaluating the feasibility of obtaining another data center in a remote location to enable further growth.One of the web hosting company's eCommerce customers notifies them that they are launching an enormous holiday sale, beginning in a few weeks. They expect utilization of their virtual server farm to double or triple for the next three to six months. The web hosting company cannot deploy the needed resources in a new data center in time for the sale. They opt to purchase services from a cloud service provider using a pay-as-you-go model.Over the next two weeks, Layer 2 connectivity is established between the two sites. The web hosting company's IT staff works with the CSP to configure the necessary physical and virtual infrastructure. All traffic to the public cloud is routed through the private data center, across the Layer 2 connection. A local load balancer is deployed in the private data center. Orchestration tools are configured to burst the service into the public cloud automatically when utilization reaches 80%.-- Exhibit -To test the functionality of the new infrastructure, a load simulator is used to increase utilization on the servers. At 80% utilization, the orchestration tools provision the required resources in the public cloud. However, the utilization on the private cloud resources continues to increase, while the utilization on the public cloud resources remains at 0%.What is the most likely cause of this problem?**A.** The wrong VLANs are configured across the network link**B.** The global load balancer is not being

updated with the new service information **C**. The local load balancer is not being updated with the new service information **D**. The wrong subnets are configured across the network link

**Answer: C**
