NEW QUESTION: 1 You have recently joined a startup company building sensors to measure street noise and air quality in urban areas. The company has been running a pilot deployment of around 100 sensors for 3 months each sensor uploads 1KB of sensor data every minute to a backend hosted on AWS. During the pilot, you measured a peak of 10 IOPS on the database, and you stored an average of 3GB of sensor data per month in the database. The current deployment consists of a load-balanced auto scaled Ingestion layer using EC2 instances and a PostgreSQL RDS database with 500GB standard storage. The pilot is considered a success and your CEO has managed to get the attention of some potential investors. The business plan requires a deployment of at least 100K sensors which needs to be supported by the backend. You also need to store sensor data for at least two years to be able to compare year over year improvements. To secure funding, you have to make sure that the platform meets these requirements and leaves room for further scaling. Which setup will meet the requirements?
A. Keep the current architecture but upgrade RDS storage to 3TB and 10K provisioned IOPS
B. Ingest data into a DynamoDB table and move old data to a Redshift cluster
C. Replace the RDS instance with a 6 node Redshift cluster with 96TB of storage
D. Add an SQS queue to the ingestion layer to buffer writes to the RDS instance
Answer: C
Explanation: Explanation The POC solution is being scaled up by 1000, which means it will require 72TB of Storage to retain 24 months' worth of data. This rules out RDS as a possible DB solution which leaves you with Redshift. I believe DynamoDB is a more cost effective and scales better for ingest rather than using EC2 in an auto scaling group. Also, this example solution from AWS is somewhat similar for reference.

NEW QUESTION: 2 View the Exhibit and examine the description of the DEPARTMENTS and EMPLOYEES tables. To retrieve data for all the employees for their EMPLOYEE_ID, FIRST_NAME, and DEPARTMENT NAME, the following SQL statement was written: SELECT employee_id, first_name, department_name FROM employees NATURAL JOIN departments; The desired output is not obtained after executing the above SQL statement. What could be the reason for this?
A. The DEPARTMENTS table is not used before the EMPLOYEES table in the FROM clause.
B. The EMPLOYEES and DEPARTMENTS tables have more than one column with the same column name and data type.
C. The table prefix is missing for the column names in the SELECT clause.
D. The NATURAL JOIN clause is missing the USING clause.
Answer: B

NEW QUESTION: 3 Amazon EMRは何を表していますか？**A.** Encrypted Machine Rendering**B.** Encrypted Machine Reads**C.** Elastic Magnetic Resonance**D.** Elastic MapReduce**Answer: D**
Explanation:説明Amazon EMRはElastic MapReduce (Amazon EMR) の略です。Amazon EMRは、Apache HadoopやApache SparkなどのビッグデータフレームワークをAWSで実行して膨大な量のデータを処理および分析することを簡素化するマネージドクラスタープラットフォームです。これらのフレームワークと、Apache HiveやApache Pigなどの関連するオープンソースプロジェクトを使用すると、分析目的やビジネスインテリジェンスワークロードのためにデータを処理できます。

NEW QUESTION: 4 HOTSPOT**Answer:** Explanation: We need to reconfigure all the meetings/conferences that require authentication or in other words, all meetings/conferences that do not allow anonymous users. We do this by running the Get-CsMeetingConfiguration cmdlet without any parameters to return a collection of all the meeting configuration settings currently in use. That collection is then piped to the Where-Object cmdlet, which selects only those settings where the AdmitAnonymousUsersByDefault property is equal to false. Now that we have all the meetings/conferences that require authentication, we can use the Set-CSMeetingConfiguration to reconfigure those meetings to enable the users to bypass the lobby by using the PstnCallersBypassLobby = True parameter.
