**NEW QUESTION: 1** Refer to the exhibit. An administrator needs to create two additional copies of a backup image stored on a tape but the Setup Duplication Variables window will only allow one additional copy to be configured. What is a likely cause? **A.** The Maximum Concurrent Jobs property in the Storage Unit is set to 2. **B.** The Maximum Backup Copies in the Master Server Host Properties is set to 2. **C.** The Media multiplexing in the schedule is set to 2. **D.** The Limit Jobs per Policy property in the Backup policy is set to 2. **Answer: B**

**NEW QUESTION: 2** Your network contains an Active Directory forest named contoso.com. The forest contains a server named Server1 that is configured as an enterprise certification authority (CA). The forest contains a server named Server2 that has the Network Policy Server (NPS) role service installed. You deploy Network Access Protection (NAP). You discover that Server1 fails to issue health certificates. You need to ensure that health certificates can be issued. What should you do? **A.** From the Network Policy Server console, modify the Windows System Health Validators settings. **B.** From the Network Policy Server console, create a new health policy. **C.** Install the Host Credential Authorization Protocol (HCAP) role service on Server1. **D.** Install an additional server, configure the new server as a standalone CA, and then configure the Health Registration Authority (HRA) to use the CA. **Answer: D**

**NEW QUESTION: 3** Refer to the exhibit. At the end of an RSTP election process, which access layer switch port will assume the discarding role? **A.** Switch3, port fa0/12 **B.** Switch3, port Gi0/1 **C.** Switch4, port fa0/11 **D.** Switch3, port Gi0/2 **E.** Switch4, port fa0/2 **F.** Switch3, port fa0/1 **Answer: C** Explanation: Explanation In this question, we only care about the Access Layer switches (Switch3 & 4). Switch 3 has a lower bridge ID than Switch 4 (because the MAC of Switch3 is smaller than that of Switch4) so both ports of Switch3 will be in forwarding state. The alternative port will surely belong to Switch4. Switch4 will need to block one of its ports to avoid a bridging loop between the two switches. But how does Switch4 select its blocked port? Well, the answer is based on the BPDUs it receives from Switch3. A BPDU is superior to another if it has: 1. A lower Root Bridge ID 2. A lower path cost to the Root 3. A lower Sending Bridge ID 4. A lower Sending Port ID These four parameters are examined in order. In this specific case, all the BPDUs sent by Switch3 have the same Root Bridge ID, the same path cost to the Root and the same Sending Bridge ID. The only parameter left to select the best one is the Sending Port ID (Port ID = port priority + port index). In this case the port priorities are equal because they use the default value, so Switch4 will compare port index values, which are unique to each port on the switch, and because Fa0/12 is inferior to Fa0/1, Switch4 will select the port connected with

Fa0/1 (of Switch3) as its root port and block the other port -> Port fa0/11 of Switch4 will be blocked (discarding role).

**NEW QUESTION: 4**What is the purpose of an OTV edge device?**A.** connect to other data centers  
**B.** connect to the access layer**C.** connect to the end users**D.** connect to mobile devices**Answer:**  
**A**Explanation:

[https://www.cisco.com/c/en/us/td/docs/solutions/Enterprise/Data\\_Center/DCI/whitepaper/D\\_CI3\\_OTV\\_Intro/DCI\\_1.html](https://www.cisco.com/c/en/us/td/docs/solutions/Enterprise/Data_Center/DCI/whitepaper/D_CI3_OTV_Intro/DCI_1.html)"Edge DeviceThe edge device (Figure 1-1) performs OTV functions: it receives the Layer 2 traffic for all VLANs that need to be extended to remote locations and dynamically encapsulates the Ethernet frames into IP packets that are then sent across the transport infrastructure.[...]Finally, the OTV edge device can be positioned in different parts of the data center.
