**NEW QUESTION: 3** In which phase of the System Development Lifecycle (SDLC) is Security Accreditation Obtained?  
**A.** Testing and evaluation control  
**B.** Functional Requirements Phase  
**C.** Acceptance Phase  
**D.** Postinstallation Phase  
**Answer: A**  
**Explanation:** A project management tool that can be used to plan, execute, and control a software development project is the systems development life cycle (SDLC). The SDLC is a process that includes systems analysts, software engineers, programmers, and end users in the project design and development. Because there is no industry-wide SDLC, an organization can use any one, or a combination of SDLC methods. The SDLC simply provides a framework for the phases of a software development project from defining the functional requirements to implementation. Regardless of the method used, the SDLC outlines the essential phases, which can be shown together or as separate elements. The model chosen should be based on the project. For example, some models work better with long-term, complex projects, while others are more suited for short-term projects. The key element is that a formalized SDLC is utilized. The number of phases can range from three basic phases (concept, design, and implement) on up. The basic phases of SDLC are: Project initiation and planning, Functional requirements definition, System design specifications, Development and implementation, Documentation and common program controls, Testing and evaluation control, (certification and accreditation), Transition to production (implementation). The system life cycle (SLC) extends beyond the SDLC to include two additional phases: Operations and maintenance support (post-installation), Revisions and system replacement. The following answers are
