**NEW QUESTION: 1**An application is throwing unhandled `NullReferenceException` and `FormatException` errors. The stack trace shows that the exceptions occur in the `GetWebResult()` method. The application includes the following code to parse XML data retrieved from a web service. (Line numbers are included for reference only.) You need to handle the exceptions without interfering with the existing error-handling infrastructure. Which two actions should you perform? (Each correct answer presents part of the solution. Choose two.)  
**A.** Option **A**. Option **B**. Option **C**. Option **D**.  
**Answer: A, D**  
**Explanation/Reference:**  
**Explanation:**  
**A:** The `TryParse` method is like the `Parse` method, except the `TryParse` method does not throw an exception if the conversion fails. It eliminates the need to use exception handling to test for a `FormatException` in the event that `s` is invalid and cannot be successfully parsed.  
**C:** `UnhandledException` event handler  
If the `UnhandledException` event is handled in the default application domain, it is raised there for any unhandled exception in any thread, no matter what application domain the thread started in. If the thread started in an application domain that has an event handler for `UnhandledException`, the event is raised in that application domain.
