NEW QUESTION: 1You upgrade a SharePoint Server 2010 server farm to SharePoint Server 2013. Several users report that a site collection site has the visual elements of SharePoint Server 2010.You need to ensure that the site collection uses the visual elements of SharePoint Server 2013.Which cmdlet should you run?**A.** Upgrade-SPSite**B.** Repair-SPSite**C.** Copy-SPSite**D.** Restore-SPSite**Answer: A****Explanation:**The Upgrade-SPSite cmdlet starts the upgrade process on a site collection. The Upgrade-SPSite cmdlet activates the upgrade process for the specified SPSite object. You can also use this cmdlet to resume failed upgrades. When you use this cmdlet to initiate upgrade on an SPSite object, the object can be either a build-to-build or version-to-version upgrade. By default, the Upgrade-SPSite cmdlet operates as a build-to-build upgrade. This prevents unexpected version upgrades of site collections if you use this cmdlet after a patching operation. When in version-to-version upgrade mode, site collection health checks are run in repair mode to ensure that the site collection is healthy enough to upgrade successfully. If successful, the remainder of the upgrade occurs.

NEW QUESTION: 2You have configured a TLS link between Avaya Aura(R) Communication manager {CM) and Avaya Aura(R)Session Manager (SM). SM is using Identity certificates that have been signed by Avaya Aura(R) SystemManager (SMGR) Certificate Authority (CA).What are three of the things that need to be done for the signaling link between CM and Avaya Aura(R) Session Manager (SM) to come into service?
