SQLFilterNeed to use relational operators so an SQL Filter is needed.AllOrders: No FilterSQL
Filter: SQL Filters - A SqlFilter holds a SQL-like conditional expression that is evaluated in the
broker against the arriving messages' user-defined properties and system properties. All
system properties must be prefixed with sys. in the conditional expression. The SQL-language
subset for filter conditions tests for the existence of properties (EXISTS), as well as for
null-values (IS NULL), logical NOT/AND/OR, relational operators, simple numeric arithmetic,
and simple text pattern matching with LIKE.Correlation Filters - A CorrelationFilter holds a set
of conditions that are matched against one or more of an arriving message's user and system
properties. A common use is to match against the CorrelationId property, but the application
can also choose to match against ContentType, Label, MessageId, ReplyTo, ReplyToSessionId,
SessionId, To, and any user-defined properties. A match exists when an arriving message's
value for a property is equal to the value specified in the correlation filter. For string
expressions, the comparison is case-sensitive. When specifying multiple match properties, the
filter combines them as a logical AND condition, meaning for the filter to match, all conditions
must match.Boolean filters - The TrueFilter and FalseFilter either cause all arriving messages
(true) or none of the arriving messages (false) to be selected for the subscription.References:
