**NEW QUESTION: 1**Which three values can be used to tag external EIGRP routes? (Choose three.)**A.** The router ID of the router that redistributed the route**B.** The administrative distance of the external protocol**C.** The metric from the external protocol**D.** The router ID of the router from which the external protocol route was learned**E.** The cost to reach the router that redistributed the route**F.** The protocol ID of the external protocol**Answer: A,C,F****Explanation:** EIGRP has the notion of internal and external routes. Internal routes are ones that have been originated within an EIGRP autonomous system (AS). Therefore, a directly attached network that is configured to run EIGRP is considered an internal route and is propagated with this information throughout the EIGRP AS. External routes are ones that have been learned by another routing protocol or reside in the routing table as static routes. These routes are tagged individually with the identity of their origination. External routes are tagged with the following information: The router ID of the EIGRP router that redistributed the route. The AS number where the destination resides. A configurable administrator tag. Protocol ID of the external protocol. The metric from the external protocol. Bit flags for default routing.
