NEW QUESTION: 1Which of the following would be used to implement Mandatory Access Control (MAC)?
A. User dictated access control
B. Lattice-based access control
C. Clark-Wilson Access Control
D. Role-based access control
Answer: B
Explanation:The lattice is a mechanism use to implement Mandatory Access Control (MAC) Under Mandatory Access Control (MAC) you have: Mandatory Access Control Under-Non Discretionary Access Control (NDAC) you have: Rule-Based Access Control Role-Based Access Control Under Discretionary Access Control (DAC) you have: Discretionary Access Control The Lattice Based Access Control is a type of access control used to implement other access control method. A lattice is an ordered list of elements that has a least upper bound and a most lower bound. The lattice can be used for MAC, DAC, Integrity level, File Permission, and more For example in the case of MAC, if we look at common government classifications, we have the following:
TOP SECRET
SECRET ----- I am the user at secret
CONFIDENTIAL
SENSITIVE BUT UNCLASSIFIED
UNCLASSIFIED
If you look at the diagram above where I am a user at SECRET it means that I can access document at lower classification but not document at TOP SECRET. The lattice is a list of ORDERED ELEMENT, in this case the ordered elements are classification levels. My least upper bound is SECRET and my most lower bound is UNCLASSIFIED. However the lattice could also be used for Integrity Levels such as:
VERY HIGH
HIGH
MEDIUM ----- I am a user, process, application at the medium level
LOW
VERY LOW
In the case of Integrity levels you have to think about TRUST. Of course if I take for example the VISTA operating system which is based on Biba then Integrity Levels would be used. As a user having access to the system I cannot tell a process running with administrative privilege what to do. Else any users on the system could take control of the system by getting highly privilege process to do things on their behalf. So no read down would be allowed in this case and this is an example of the Biba model. Last but not least the lattice could be use for file permissions:
RWXRW ----- User at this level
If I am a user with READ and WRITE (RW) access privilege then I cannot execute the file because I do not have execute permission which is the X

under Linux and UNIX. Many people confuse the Lattice Model and many books say MAC = LATTICE, however the lattice can be used for other purposes. There is also Role Based Access Control (RBAC) that exists out there. It COULD be used to simulate MAC but it is not MAC as it does not make use of Label on objects indicating sensitivity and categories. MAC also requires a clearance that dominates the object. You can get more info about RBAC at: <http://csrc.nist.gov/groups/SNS/rbac/faq.html> Also note that many books use the same acronym for Role Based Access Control and Rule Based Access Control which is RBAC, this can be confusing. The proper way of writing the acronym for Rule Based Access Control is RuBAC, unfortunately it is not commonly used.
