**NEW QUESTION: 1**Your company has three offices. Each office is configured as an Active Directory site. You have three servers that have Exchange Server 2013 installed named EX1, EX2 and EX3. All three servers have the Client Access server role and the Mailbox server role installed. The Active Directory site links and costs are configured as shown in the exhibit. (Click the Exhibit button.) Site B is designated as a hub site. EX2 fails. You discover that all email messages sent from the users in Site A to the users in Site C are queued on a server in Site A. You need to ensure that the email messages are sent to Site C as quickly as possible. What should you do first? **A.** Configure Site A as a hub site. **B.** Remove the hub site. **C.** Modify the Exchange-specific site link cost. **D.** Modify the Active Directory site link costs. **Answer: B**

**NEW QUESTION: 2**Michael is creating an XPage for his company's satellite tracking application. The XPage is bound to the satinfo form as a data source that contains basic information about the requested satellite. There is also a custom control on the XPage that is bound to the maintenance form as a data source, which displays information about the satellite's maintenance history. When Michael adds a submit button to the XPage, he wants the data entered into either section to be saved to the appropriate form. What does Michael need to do to accomplish this? **A.** Click the submit button, then select the events view. Next select the onclick mouse event, and click "Add Action". Select "Save Data Sources". **B.** Click the submit button, then select the actions view. Next select the onclick mouse event, and click "Add Action". Select "Save DataSources". **C.** Click the submit button, then select the data view. Next select the onclick mouse event, and click "Add Action". Select "Save Data Sources". **D.** Click the submit button, then select the properties view. Next select the onclick mouse event, and click "Add Action". Select "Save DataSources". **Answer: A**

**NEW QUESTION: 3**SQL1という名前のMicrosoft SQL Serverインスタンスを含むオンプレミスネットワークがあります。App1という名前のAzureロジックアプリを作成します。App1がSQL1上のデータベースをクエリできることを確認する必要があります。どの3つのアクションを順番に実行する必要がありますか？回答するには、適切なアクションをア

クシヨンのリストから回答領域に移動し、正しい順序に並べます。 **Answer:** Explanation: Explanation: To access data sources on premises from your logic apps, you can create a data gateway resource in Azure so that your logic apps can use the on-premises connectors. Box 1: From an on-premises computer, install an on-premises data gateway. Before you can connect to on-premises data sources from Azure Logic Apps, download and install the on-premises data gateway on a local computer. Box 2: From the Azure portal, create an on-premises data gateway. Create Azure resource for gateway. After you install the gateway on a local computer, you can then create an Azure resource for your gateway. This step also associates your gateway resource with your Azure subscription. \* Sign in to the Azure portal. Make sure you use the same Azure work or school email address used to install the gateway. On the main Azure menu, select Create a resource > Integration > On-premises data gateway. \* On the Create connection gateway page, provide this information for your gateway resource. \* To add the gateway resource to your Azure dashboard, select Pin to dashboard. When you're done, choose Create. Box 3: From the Logic Apps Designer in the Azure portal, add a connector. After you create your gateway resource and associate your Azure subscription with this resource, you can now create a connection between your logic app and your on-premises data source by using the gateway. \* In the Azure portal, create or open your logic app in the Logic App Designer. \* Add a connector that supports on-premises connections, for example, SQL Server. \* Set up your connection.
