**NEW QUESTION: 1** Which IP connection characteristic is unique to file-based storage access? **A.** Bandwidth throttle **B.** Link Aggregation **C.** Mirrored writes **D.** VLAN tagging **Answer: D**

**NEW QUESTION: 2** エンジニアは、Cisco

IOS暗号マップベースのVPNを展開しており、状態情報がHAグループで共有されるようにしたいと考えています。どの高可用性テクノロジーを使用する必要がありますか? **A.** HSRP **B.** VRRP **C.** GLBP

**D.** SSL **Answer: A** Explanation: Explanation Stateful failover for IPsec is designed to work in conjunction with stateful switchover (SSO) and Hot Standby Routing Protocol (HSRP). HSRP provides network redundancy for IP networks, ensuring that user traffic immediately and transparently recovers from failures in network edge devices or access circuits. That is, HSRP monitors both the inside and outside interfaces so that if either interface goes down, the whole router is deemed to be down and the ownership of Internet Key Exchange (IKE) and IPsec security associations (SAs) is passed to the standby router (which transitions to the HSRP active state). SSO allows the active and standby routers to share IKE and IPsec state information so both routers have enough information to become the active router at any time. To configure stateful failover for IPsec, a network administrator must enable HSRP, assign a virtual IP address (VIP), and enable SSO.

**NEW QUESTION: 3** You have a DNS server named Server1. Server1 has a primary zone named contoso.com. Zone Aging/Scavenging is configured for the contoso.com zone. One month ago, an administrator removed a server named Server2 from the network. You discover that a static resource record for Server2 is present in contoso.com. Resource records for decommissioned client computers are removed automatically from contoso.com. You need to ensure that the static resource records for all of the servers are removed automatically from contoso.com. What should you modify? **A.** The Security settings of the static resource records **B.** The time-to-live (TTL) value of the static resource records **C.** The Expires after value of contoso.com **D.** The Record time stamp value of the static resource records **Answer: D** Explanation: Reset and permit them to use a current (non-zero) time stamp value. This enables these records to become aged and scavenged. You can use this procedure to change how a specific resource record is scavenged. A stale record is a record where both the No-Refresh Interval and Refresh Interval have passed without the time stamp updating. DNS->View->Advanced Depending on the how the resource record was originally added to the zone, do one of the following: If the record was added dynamically using dynamic update, clear the Delete this record when it becomes stale

check box to prevent its aging or potential removal during the scavenging process. If dynamic updates to this record continue to occur, the Domain Name System (DNS) server will always reset this check box so that the dynamically updated record can be deleted. If you added the record statically, select the Delete this record when it becomes stale check box to permit its aging or potential removal during the scavenging process.<http://technet.microsoft.com/en-us/library/cc759204%28v=ws.10%29.aspx> Typically, stale DNS records occur when a computer is permanently removed from the network. Mobile users who abnormally disconnect from the network can also cause stale DNS records. To help manage stale records, Windows adds a time stamp to dynamically added resource records in primary zones where aging and scavenging are enabled. Manually added records are time stamped with a value of 0, and they are automatically excluded from the aging and scavenging process. To enable aging and scavenging, you must do the following: Resource records must be either dynamically added to zones or manually modified to be used in aging and scavenging operations. Scavenging and aging must be enabled both at the DNS server and on the zone. Scavenging is disabled by default. DNS scavenging depends on the following two settings: No-refresh interval: The time between the most recent refresh of a record time stamp and the moment when the time stamp can be refreshed again. When scavenging is enabled, this is set to 7 days by default. Refresh interval: The time between the earliest moment when a record time stamp can be refreshed and the earliest moment when the record can be scavenged. The refresh interval must be longer than the maximum record refresh period. When scavenging is enabled, this is set to 7 days by default. A DNS record becomes eligible for scavenging after both the no-refresh and refresh intervals have elapsed. If the default values are used, this is a total of 14 days.<http://technet.microsoft.com/en-us/library/cc759204%28v=ws.10%29.aspx><http://technet.microsoft.com/en-us/library/cc771570.aspx><http://technet.microsoft.com/en-us/library/cc771677.aspx>[http://technet.microsoft.com/en-us/library/cc758321\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/cc758321(v=ws.10).aspx)
