### NEW QUESTION: 1

あなたは、データを複数の出力フォーマットに変えるアプリケーションを開発しています。アプリケーションは、次のコードが含まれています。(行番号は参考のために含まれるだけです。)あなたは、タブ区切りの出力を生成するコードセグメントを開発しています。

すべての出力ルーチンは、次のインターフェイスを実装しています：

あなたはGetOutput () メソッドの完了時間を最小化する必要があります。

あなたはライン06でどのコードセグメントを挿入するべきですか？ **A.** Option **D.** Option **B.** Option **C.**

**Option CD. Option A****Answer: B****Explanation:**A String object concatenation operation always creates a new object from the existing string and the new data.A StringBuilder object maintains a buffer to accommodate the concatenation of new data. New data is appended to the buffer if room is available; otherwise, a new, larger buffer is allocated, data from the original buffer is copied to the new buffer, and the new data is then appended to the new buffer.The performance of a concatenation operation for a String or StringBuilder object depends on the frequency of memory allocations. A String concatenation operation always allocates memory, whereas a StringBuilder concatenation operation allocates memory only if the StringBuilder object buffer is too small to accommodate the new data. Use the String class if you are concatenating a fixed number of String objects. In that case, the compiler may even combine individual concatenation operations into a single operation. Use a StringBuilder object if you are concatenating an arbitrary number of strings; for example, if you're using a loop to concatenate a random number of strings of user input.

**NEW QUESTION: 3** Contoso, Ltd. plans to use Office 365 for email services and Skype for Business Online. Contoso has four unique domain names. You need to migrate domain names to Office 365. Which two domain names should you exclude from the migration? Each correct answer presents part of the solution. **A.** contoso **B.** contoso.co **C.** contoso.us **D.** contoso.local

**Answer: A, D**  
**Explanation:** Explanation/Reference: Explanation: There are no practical limits on the number of domains that can be verified to Office 365 Enterprise. The rules are simple: you need to verify a domain, and you need to assign the domain based on the needs (or Domain Intent). Domain Intent is what the domain services will be configured as; there are three different types of services for Domain Intent. A top-level domain (TLD) is the part of the domain name located to the right of the dot (" . "). The most common TLDs are .com, .net, and .org. Some others are .biz, .info, and .ws. These common TLDs all have certain guidelines, but are generally available to any registrant, anywhere in the world. **B:** contoso- single labeled domain / or also known as a second-level domain - not valid **C:** contoso.local - internal labeled domain - not valid
