NEW QUESTION: 1Note: This question is a part of a series of questions that present the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series.
Start of repeated scenario
You have a Microsoft SQL Server database that contains the following tables. The following columns contain data information:
Date[Month] in the mmyyyy format
Date[Date_ID] in the ddmmmyyyy format
Date[Date_name] in the mm/dd/yyyy format
Monthly_returns[Month_ID] in the mmyyyy format
The Order table contains more than one million rows. The Store table has relationship to the Monthly_returns table on the Store_ID column. This is the only relationship between the tables. You plan to use Power BI desktop to create an analytics solution for the data.
End of repeated scenario.
You plan to create a chart that displays total Order [Order_amount] by Store [Name]. You need to modify the model to ensure that you can create the chart. Which two actions should you perform? Each correct answer presents part of the solution. NOTE: Each correct selection is worth one point.
A. To the Order table, add a measure that uses the COUNT ('Order'[Order_amount]) DAX formula.
B. To the Order table, add a column that uses the RELATED('Store' [Store_ID]) DAX formula.
C. Create a relationship between the Order table and the Store table.
D. To the order table, add a measure that uses the SUM ('Order' [Order_amount]) DAX formula.
Answer: B,D

NEW QUESTION: 3Which two statements about Cisco Express Forwarding are true? (Choose two.)
A. Cisco Express Forwarding tables contain reachability information and adjacency tables contain forwarding information.
B. Cisco Express Forwarding tables contain forwarding information and adjacency tables contain reachability information.
C. Adjacency tables and Cisco Express Forwarding tables require packet process-switching.
D. Changing MAC header rewrite strings requires cache validation.
E. Adjacency tables and Cisco Express Forwarding tables can be built separately.
Answer: A,E
Explanation: Main Components of CEF
Information

conventionally stored in a route cache is stored in several data structures for Cisco Express Forwarding. The data structures provide optimized lookup for efficient packet forwarding. The two main components of Cisco Express Forwarding operation are the forwarding information base (FIB) and the adjacency tables. The FIB is conceptually similar to a routing table or information base. A router uses this lookup table to make destination-based switching decisions during Cisco Express Forwarding operation. The FIB is updated when changes occur in the network and contains all routes known at the time. Adjacency tables maintain Layer 2 next-hop addresses for all FIB entries. This separation of the reachability information (in the Cisco Express Forwarding table) and the forwarding information (in the adjacency table), provides a number of benefits: The adjacency table can be built separately from the Cisco Express Forwarding table, allowing both to be built without any packets being process-switched. The MAC header rewrite used to forward a packet is not stored in cache entries, so changes in a MAC header rewrite string do not require validation of cache entries.
