NEW QUESTION: 2The Orders form is a master-detail form in which ORDERS is a single-record master block and ORDER_ITEMS is a multirecord detail block. During testing of the Orders form, users have complained about the behavior of Enter-Query mode. In the form they are testing, they are unable to navigate out of the current block while they are in Enter-Query mode. However, they would like to be able to carry out the following procedure: 1 . Press [Enter Query] while in the master block. 2 . Enter some search criteria. 3 . Navigate to the detail block. 4 . Enter more search criteria (while the form is still in Enter-Query mode). 5 . Press [Execute Query] to have the criteria applied to both blocks at once. How can you provide the requested functionality?**A.** Use a Key-Entqry trigger on the master block to redirect the focus to the detail block after the search criteria have been entered in the master block.**B.** You cannot perform the requested operation with a master-detail form. The restriction on navigating out of the current block during Enter-Query mode cannot be circumvented.**C.** Use a Key-Nxtblk trigger on the ORDERS block to cause navigation to the ORDER_ITEMS block. This will work because Key triggers can fire in Enter-Query mode and can call restricted built-ins such as GO_BLOCK().**D.** Use a combination of Key-Entqry and Key-Exeqry triggers at form level to call generically written procedures to test where the current focus is and set global variables that a form-level Key-Nxtblk trigger can use to redirect the focus.**E.** The requested functionality is the default behavior. You simply need to remove or rewrite the triggers you wrote that "broke" the form.**F.** Use a Key-Exeqry trigger on both the master and detail blocks to call a centralized procedure and have the procedure handle the navigation.**Answer: B**

Explanation: Explanation Using Amazon S3 Origins, MediaPackage Channels, and Custom Origins for Web Distributions Using Amazon S3 Buckets for Your Origin When you use Amazon S3 as an origin for your distribution, you place any objects that you want CloudFront to deliver in an Amazon S3 bucket. You can use any method that is supported by Amazon S3 to get your objects into Amazon S3, for example, the Amazon S3 console or API, or a third-party tool. You can create a hierarchy in your bucket to store the objects, just as you would with any other Amazon S3 bucket. Using an existing Amazon S3 bucket as your CloudFront origin server doesn't change the bucket in any way; you can still use it as you normally would to store and access Amazon S3 objects at the standard Amazon S3 price. You incur regular Amazon S3 charges for storing the objects in the bucket. Using Amazon S3 Buckets Configured as Website Endpoints for Your Origin You can set up an Amazon S3 bucket that is configured as a website endpoint as custom origin with CloudFront. When you configure your CloudFront distribution, for the origin, enter the Amazon S3 static website hosting endpoint for your bucket. This value appears in the Amazon S3 console, on the Properties tab, in the Static website hosting pane. For example: <http://bucket-name.s3-website-region.amazonaws.com> For more information about specifying Amazon S3 static website endpoints, see Website endpoints in the Amazon Simple Storage Service Developer Guide. When you specify the bucket name in this format as your origin, you can use Amazon S3 redirects and Amazon S3 custom error documents. For more information about Amazon S3 features, see the Amazon S3 documentation. Using an Amazon S3 bucket as your CloudFront origin server doesn't change it in any way. You can still use it as you normally would and you incur regular Amazon S3 charges.
