NEW QUESTION: 1 Which two statements are true about the role of cluster master in whole server migration? (Choose two.)
A. There is exactly one cluster master in the cluster at a given point of time.
B. The cluster master must host all the pinned services in the cluster.
C. A cluster master must always be different from a singleton master.
D. The cluster master must always be started with the node manager.
E. Any managed server in the cluster can serve as the cluster master.
Answer: A, E
Explanation: Explanation One server instance in a cluster that contains migratable servers acts as the cluster master and orchestrates the process of automatic server migration, in the event of failure. Any Managed Server in a cluster can serve as the cluster master, whether it hosts pinned services or not. Note: Any server instance in the cluster can serve as the cluster master. When you start a cluster that contains migratable servers, the first server to join the cluster becomes the cluster master and starts up the cluster manager service. If a cluster does not include at least one migratable server, it does not require a cluster master, and the cluster master service does not start up.

NEW QUESTION: 2 A. Transparent Interconnection of Lots of Links B. vPCC. OTVD. FCoE
Answer: A

NEW QUESTION: 3 Which two statements are true for NFS v4.1 firewall behavior? (Choose two.)
A. It sets allowed. All flag to FALSE.
B. It closes port 2049.
C. It sets allowed. All flag to TRUE.
D. It opens port 2049.
Answer: C, D
Explanation: Explanation/Reference: Explanation: NFS v4.1 Firewall Behavior When you mount the first NFS v4.1 datastore, ESXI enables the nfs41client rule set and sets its allowed All flag to TRUE. This action opens port 2049 for all IP address. Unmounting an NFS v4.1 datastore does not affect the firewall state. That is, the first NFS v4.1 mount opens port 2049 and that port remains enabled unless you close it explicitly.
