NEW QUESTION: 1 News outlets are beginning to report on a number of retail establishments that are experiencing payment card data breaches. The data exfiltration is enabled by malware on a compromised computer. After the initial exploit, network mapping and fingerprinting is conducted to prepare for further exploitation. Which of the following is the MOST effective solution to protect against unrecognized malware infections?**A.** Update router configuration to pass all network traffic through a new proxy server with advanced malware detection.**B.** Remove local admin permissions from all users and change anti-virus to a cloud aware, push technology.**C.** Deploy a network based heuristic IDS, configure all layer 3 switches to feed data to the IDS for more effective monitoring.**D.** Implement an application whitelist at all levels of the organization.**Answer: D** Explanation: In essence a whitelist screening will ensure that only acceptable applications are passed/ or granted access. Incorrect Answers: A: Removing all local administrator permissions and changing to cloud aware is not going to keep unrecognized malware infections at bay. C: Heuristic based IDS will only look for deviation of normal behavior of an application or service and thus is useful against unknown and polymorphic viruses. D: Modifying the router configuration to pass all the network traffic via a new proxy server is not the same as protecting against unrecognized malware infections because the company's malware detection program in use is still the same.
