NEW QUESTION: 1

会社のWebサーバーのセキュリティを分析しているセキュリティは、次の出力を受け取ります。問題は次のうちどれですか？**A. アクセス違反B. ストアドプロシージャC. コード署名D. 暗号化されていない資格情報****Answer: D**

NEW QUESTION: 2

ペンテスターは、強力で複雑なパスワードを強制するWindowsドメインでパスワードを解読しようとしなければなりません。次のうちどれが最短期間でMOSTパスワードをクラックするのでしょうか？**A. オンラインパスワードテストB. 辞書攻撃C. レインボーテーブル攻撃D. 総当たり攻撃****Answer: C****Explanation:**ExplanationThe passwords in a Windows (Active Directory) domain are encrypted. When a password is "tried" against a system it is "hashed" using encryption so that the actual password is never sent in clear text across the communications line. This prevents eavesdroppers from intercepting the password. The hash of a password usually looks like a bunch of garbage and is typically a different length than the original password. Your password might be "shitzu" but the hash of your password would look something like "7378347eedbfd761619451949225ec1". To verify a user, a system takes the hash value created by the password hashing function on the client computer and compares it to the hash value stored in a table on the server. If the hashes match, then the user is authenticated and granted access. Password cracking programs work in a similar way to the login process. The cracking program starts by taking plaintext passwords, running them through a hash algorithm, such as MD5, and then compares the hash output with the hashes in the stolen password file. If it finds a match then the program has cracked the password. Rainbow Tables are basically huge sets of precomputed tables filled with hash values that are pre-matched to possible plaintext passwords. The Rainbow Tables essentially allow hackers to reverse the hashing function to determine what the plaintext password might be. The use of Rainbow Tables allow for passwords to be cracked in a very short amount of time compared with brute-force methods, however, the trade-off is that it takes a lot of storage (sometimes Terabytes) to hold the Rainbow Tables themselves.

NEW QUESTION: 3A customer purchases Microsoft Operations Management and Security E1 through an Enterprise Agreement (EA). Which on-premises software is included?**A. Windows Server StandardB. Windows Server DatacenterC. Microsoft System Center StandardD. Microsoft System Center Datacenter****Answer: D**

NEW QUESTION: 4Which measure is used by an NTP server to indicate its closeness to the authoritative time source?**A. hop countB. latencyC. stratumD. time zone****Answer: C****Explanation:**ExplanationThe stratum levels define the distance from the reference clock. A reference clock is a stratum 0 device that is assumed to be accurate and has little or no delay associated with it. Stratum 0 servers cannot be used on the network but they are directly connected to computers

which then operate as stratum-1 servers. A stratum 1 time server acts as a primary network time standard. A stratum 2 server is connected to the stratum 1 server; then a stratum 3 server is connected to the stratum 2 server and so on. A stratum 2 server gets its time via NTP packet requests from a stratum 1 server. A stratum 3 server gets its time via NTP packet requests from a stratum-2 server...
