NEW QUESTION: 1 You are deploying an Azure Kubernetes Services (AKS) cluster that will use multiple containers. You need to create the cluster and verify that the services for the containers are configured correctly and available. Which four commands should you use to develop the solution? To answer, move the appropriate command segments from the list of command segments to the answer area and arrange them in the correct order.**Answer:**
Explanation: Explanation
Step 1: az group create
Create a resource group with the az group create command. An Azure resource group is a logical group in which Azure resources are deployed and managed. Example: The following example creates a resource group named myAKSCluster in the eastus location.
az group create --name myAKSCluster --location eastus
Step 2 : az aks create
Use the az aks create command to create an AKS cluster.
Step 3: kubectl apply
To deploy your application, use the kubectl apply command. This command parses the manifest file and creates the defined Kubernetes objects.
Step 4: az aks get-credentials
Configure it with the credentials for the new AKS cluster. Example:
az aks get-credentials --name aks-cluster --resource-group aks-resource-group

NEW QUESTION: 2 When does a new Sprint begin?
A. It depends on the Product Owner.
B. Every Monday.
C. Immediately after the end of the previous Sprint.
D. Immediately after the next Sprint Planning.
Answer: C

NEW QUESTION: 3 What kind of geometries cannot be stored in the Oracle database?
A. polylines with straight lines and arcs
B. LRS polygons with gaps
C. points with x, y, and z

coordinates
D. polygons with holes
E. 3D objects, including point clouds and TINs
Answer: B
Explanation: Explanation/Reference: The linear referencing system (LRS) application programming interface (API) in Oracle Spatial provides server-side LRS capabilities at the cartographic level. The linear measure information is directly integrated into the Oracle Spatial geometry structure. Geometric segments are basic LRS elements in Oracle Spatial. A geometric segment can be any of the following:
Line string: an ordered, nonbranching, and continuous geometry (for example, a simple road)
Multiline string: nonconnected line strings (for example, a highway with a gap caused by a lake or a bypass road)
Polygon (for example, a racetrack or a scenic tour route that starts and ends at the same point)
Incorrect Answers: A: Effective with Oracle9i, Spatial provides a rational and complete treatment of geodetic coordinates. Effective with release 9.2, ellipsoidal surface computations consider the curvatures of the Earth in the specified geodetic coordinate system and return correct, accurate results. In other words, Spatial queries return the right answers all the time.
B: For a polygon with holes, the outer boundary must be stored first in the SDO_ORDINATES definition, followed by coordinates of the inner boundaries.
C: A Polyline object is a shape defined by one or more paths, in which a path is a series of connected segments.
D: Oracle Spatial supports the creation and storage of three-dimensional geometry objects, Effective with Oracle Database Release 11.1, Oracle Spatial supports the storage and retrieval of three-dimensional spatial data, which can include points, point clouds (collections of points), lines, polygons, surfaces, and solids.
