## Sample Questions

You can also print several pieces of the pdf dumps, do marks as you like, We guarantee the pass rate of SC-200 dumps actual test is up to 99%, If you are looking for consultation, then you can always get in touch with us and we will provide you consultation regarding the Microsoft Certified: Security Operations Analyst Associate SC-200 exam.

We recommend taking the Analyticsexam.com practice [H35-672\\_V1.0 Exam Sample Questions](#) test for preparing Designing Business Intelligence Solutions with Microsoft Certified: Security Operations Analyst Associate Certification, reviewing your answers, brushing up on topics that you may still [HPE0-S59 Latest Exam Discount](#) be unclear about, and then take the online practice test to reassess your readiness for the exam.

To pass the SC-200 exam, careful planning and preparation are crucial to its realization, Selecting the right method will save your time and money, Part of software version of SC-200 test online materials is not available for entering in but our APP version can.

**NEW QUESTION: 1** Refer to the Exhibit. An administrator manages a High Availability (HA)/Distributed Resource Scheduler (DRS)-enabled cluster and has configured the affinity rule shown in the Exhibit. Which two statements best describe the configuration shown in the exhibit? (Choose two.)  
**A.** DRS will attempt to keep Marketing on the ESXi host 10.21.38.106.  
**B.** HA will not failover Marketing to ESXi hosts that are not in the Host Group.  
**C.** DRS will not attempt to keep Marketing on the ESXi host 10.21.28.106.  
**D.** HA will failover Marketing to ESXi hosts that are not in the Host group.  
**Answer: C, D**  
**Explanation:** Explanation/Reference:  
Explanation: B & D as per exhibit Rule settings: VM-Host Affinity Rules  
A VM-Host affinity rule specifies whether or not the members of a selected virtual machine DRS group can run on the members of a specific host DRS group. Unlike a VM-VM affinity rule, which specifies affinity (or anti-affinity) between individual virtual machines, a VM-Host affinity rule specifies an affinity relationship between a group of virtual machines and a group of hosts. There are 'required' rules (designated by "must") and 'preferential' rules (designated by "should"). A VM-Host affinity rule includes the following components. One virtual machine DRS group. One host DRS group. A designation of whether the rule is a requirement ("must") or a preference ("should") and whether it is affinity ("run on") or anti-affinity ("not run on"). Because VM-Host affinity rules are cluster-based, the virtual machines and hosts that are included in a rule must all reside in the same cluster. If a virtual machine is removed from the cluster, it loses its DRS group affiliation, even if it is later returned to the cluster.

**NEW QUESTION: 2** HOTSPOT  
**Answer:** Explanation:

**NEW QUESTION: 3** With reference to Master Data in SRM 7.2, which of the following are true?  
**A.** In SRM, both materials and services are stored as products. These are differentiated by 'Product Types'  
**B.** Product categories correspond to material hierarchies in the SAP back end system.  
**C.** If the product ID needs to be the same in SRM, as in the backend system, then this can be no longer than 21 characters.  
**D.** Master data such as products, business partners etc, is available locally in the SRM system.  
**Answer: A, D**  
**Explanation:** Explanation/Reference: All master data is available locally in the SAP Supplier Relationship Management (SRM) system. This data includes, for example, product master records, business partner master records, and product categories. You copy the master data from the back-end system to SAP SRM. In SAP SRM, both materials and services are stored as products. However, you can distinguish materials from services by the product type. Product categories correspond to material groups in the SAP back-end system. If the SAP SRM system communicates with an SAP back-end system, the

length of the product ID is restricted to a maximum of 18 characters. This should be the case even if the products are created locally, and not replicated from the back-end system. If you assign a product ID with more than 18 characters, a different number (with a maximum of 18 characters) has to be assigned in the back-end system.

**NEW QUESTION:** 4DB1という名前のSQL Server 2012データベースがあります。

DB1には、FG1、FG2、FG3、およびFG4という名前の4つのファイルグループが含まれています。次のコードを実行します。200万行がdbo.Salesに追加されました。

最初のパーティションからSalesHistoryという名前の新しいテーブルにデータを移動し、2012年12月31日からdbo.Salesを再分割して3か月間の新しい販売データをサポートする必要があります。

どのコードセグメントを実行しますか？

回答するには、適切なコードセグメントをコードセグメントのリストから回答領域に移動し、正しい順序に並べます。**Answer:** Explanation: Explanation: Note: \* Box 1 - Box 2: / You need to move the data from the first partition to a new table named SalesHistory. / First create the new table, then move the contents of the first partition. \* ( Box 3 Box 4) Drop the partition scheme and then the partition function and the recreate them (box 5-box6). First recreate the partition function. / You need, starting on December 31, 2012, repartition dbo.Sales to support new sales data for three months. / A partition function can be dropped only if there are no partition schemes currently using the partition function. If there are partition schemes using the partition function, DROP PARTITION FUNCTION returns an error.
