Explanation:Upon receiving anOpenReceiveChannelmessage, the IP phone selects the UDP port number it wants to use to receiveRTP packets and reports this information to call manager.With the SCCP protocol architecture, the majority of the H.323 processing power resides in an H.323 proxy - theCisco CallManager. The end stations (IP phones) run the Skinny client, which consumes less processing overhead. Theclient communicates with CallManager using connection-oriented (TCP/IP-based) communication to establish a callwith another H.323-compliant end station. Once Cisco CallManager has established the call, the two H.323 endstations use connectionless (UDP/IP-based) communication for audio transmissions.
