NEW QUESTION: 1 DRAG DROP Drag and drop the objects of the ACI policy model from left onto the correct definition on right.**Answer:** Explanation:

NEW QUESTION: 2 You are developing a .NET Core MVC application for customers to research hotels. The application will use Azure Search. The application will search the index using various criteria to local domains to hotels. The index will include search fields for rate, a list of amenities, and distance to the nearest airport. The application must support the following scenarios for specifying search criteria and organizing results: * Search the index by using regular expressions. * Organize results by counts for name-value pairs. * List hotels within a specified distance to an airport and that fall within a specific price range. You need to configure the Search Parameters class. Which properties should you configure? To answer, select the appropriate options in the answer area. NOTE: Each correct selection is worth one point.

Answer: Explanation:

NEW QUESTION: 3 You have a SharePoint Server 2013 server farm. You purchase an app for SharePoint from the Office Store. You plan to deploy the app to the farm. You need to recommend which changes must be made to the network infrastructure before you can deploy the app. What should you recommend? **A.** Add a host header in Internet Information Services (IIS). **B.** Add an alias (CNAME) record in DNS. **C.** Modify the Hosts file on the front-end Web servers. **D.** Modify the Web.config file on the front-end Web servers. **Answer: B** Explanation:

Before you use apps for SharePoint in your environment, you have to configure your environment to support them. If you don't configure your environment, site owners who try to install and use apps for SharePoint receive error messages. For all apps for SharePoint, you must set up a Domain Name Services (DNS) domain name to provide a hostname for the installed apps. By using a separate domain name, apps for SharePoint are separated from SharePoint sites to prevent unauthorized access to user data and to reduce the possibility of cross-site scripting attacks. The use of separate URLs for apps for SharePoint and SharePoint sites is called app isolation. You also need a DNS record so that the domain name can get correctly resolved. You can create one of two of the following types of DNS records for app for SharePoint URLs: * A wildcard Canonical Name (CNAME) record that points to the host domain assigned to the SharePoint farm. * A wildcard A record that points to the IP address for the SharePoint farm.
