NEW QUESTION: 4What would be considered the biggest drawback of Host-based Intrusion Detection systems (HIDS)?**A.** It can be very invasive to the host operating system**B.** Virtually eliminates limits associated with encryption**C.** They have an increased level of visibility and control compared to NID**D.** Monitors all processes and activities on the host system only
Answer: A**Explanation:**The biggest drawback of HIDS, and the reason many organizations resist its use, is that it can be very invasive to the host operating system. HIDS must have the capability to monitor all processes and activities on the host system and this can sometimes interfere with normal system processing.HIDS versus NIDSA host-based IDS (HIDS) can be installed on individual workstations and/ or servers to watch for inappropriate or anomalous activity. HIDSs are usually used to make sure users do not delete system files, reconfigure important settings, or put the system at risk in any other way.So, whereas the NIDS understands and monitors the network traffic, a HIDS's universe is limited to the computer itself. A HIDS does not understand or review network traffic, and a NIDS does not"look in" and monitor a system's activity. Each has its own job and stays out of the other's way.The ISC2 official study book defines an IDS as:An intrusion detection system (IDS) is a technology that alerts organizations to adverse orunwanted activity. An IDS can be implemented as part of a network device, such as a router,switch, or firewall, or it can be a dedicated IDS device monitoring traffic as it traverses the network.When used in this way, it is referred to as a network IDS, or NIDS. IDS can also be used onindividual host systems to monitor and report on file, disk, and process activity on that host. Whenused in this way it is referred to as a host-based IDS, or HIDS.An IDS is informative by nature and provides real-time information when suspicious activities areidentified. It is primarily a detective device and, acting in this traditional role, is not used to directlyprevent the suspected attack.What about IPS?In contrast, an intrusion prevention system (IPS), is a technology that monitors activity like an IDSbut will automatically take proactive preventative action if it detects unacceptable activity. An IPS permits a predetermined set of functions and actions to occur on a network or system; anythingthat is not permitted is considered unwanted activity and blocked. IPS is engineered specifically torespond in real time to an event at the system or network layer. By proactively enforcing policy,IPS can thwart not only attackers, but also authorized users attempting to perform an action that isnot within policy. Fundamentally, IPS is considered an access control and policy enforcementtechnology, whereas IDS is considered network monitoring and audit

technology. The following answers were incorrect: All of the other answers were advantages and not a drawback of using HIDS/TIP FOR THE EXAM: Be familiar with the differences that exist between an HIDS, NIDS, and IPS. Know that IDS's are mostly detective but IPS are preventive. IPS's are considered an access control and policy enforcement technology, whereas IDS's are considered network monitoring and audit technology.
