NEW QUESTION: 1 GSM reselection to LTE requires receiving parameters in SI3 and SI4.**A. False B. True****Answer: B**

NEW QUESTION: 2 You deploy a Microsoft Azure SQL Data Warehouse instance. The instance must be available eight hours each day. You need to pause Azure resources when they are not in use to reduce costs. What will be the impact of pausing resources? To answer, select the appropriate options in the answer area. NOTE: Each correct selection is worth one point.

Answer: Explanation: Explanation To save costs, you can pause and resume compute resources on-demand. For example, if you won't be using the database during the night and on weekends, you can pause it during those times, and resume it during the day. You won't be charged for DWUs while the database is paused. When you pause a database: Compute and memory resources are returned to the pool of available resources in the data center Data Warehouse Unit (DWU) costs are zero for the duration of the pause. Data storage is not affected and your data stays intact. SQL Data Warehouse cancels all running or queued operations. When you resume a database: SQL Data Warehouse acquires compute and memory resources for your DWU setting. Compute charges for your DWUs resume. Your data will be available. You will need to restart your workload queries. References:

NEW QUESTION: 3 Which two statements about IS-IS are true? (Choose two.)**A.** The hello interval can be changed on a per-interface basis with the command `isis hello-multiplier`.**B.** Both routers need to have the same hello intervals and hold timers in order to form IS-IS neighbors.**C.** The default hello interval is 10 seconds and the default hold timer is 30 seconds.**D.** Both IS-IS routers need to have the same capabilities in the hello packet in order to form neighbors.

Answer: A, C Explanation: `isis hello-interval` To specify the length of time between hello packets that the Cisco IOS software sends, use the `isis hello-interval` command in interface configuration mode. By default, a value three times the hello interval seconds is advertised as the hold time in the hello packets sent. (Change the multiplier of 3 by specifying the `isis`

hello-multiplier command.) With smaller hello intervals, topological changes are detected faster, but there is more routing traffic. The default is 10 seconds. Reference:
