NEW QUESTION: 1 Which is true regarding the `java.nio.file.Path` interface? **A.** The interface extends `WatchService` interface **B.** Implementations of this interface are not safe for use by multiple concurrent threads. **C.** Implementations of this interface are immutable. **D.** Paths associated with the default provider are not interoperable with the **Answer: A** **Explanation:** The `java.nio.file.Path` interface extends `Watchable` interface so that a directory located by a path can be registered with a `WatchService` and entries in the directory watched. **Note:** An object that may be used to locate a file in a file system. It will typically represent a system dependent file path. A `Path` represents a path that is hierarchical and composed of a sequence of directory and file name elements separated by a special separator or delimiter. A root component, that identifies a file system hierarchy, may also be present. The name element that is farthest from the root of the directory hierarchy is the name of a file or directory. The other name elements are directory names. A `Path` can represent a root, a root and a sequence of names, or simply one or more name elements. A `Path` is considered to be an empty path if it consists solely of one name element that is empty. Accessing a file using an empty path is equivalent to accessing the default directory of the file system. `Path` defines the `getFileName`, `getParent`, `getRoot`, and `subpath` methods to access the path components or a subsequence of its name elements. **Reference:** `java.nio.file.Path` Interface
