**NEW QUESTION: 1**The implementation group has been using the test bed to do an IPv6 'proof-of-concept'. After several changes to the network addressing and routing schemes, a trouble ticket has been opened indicating that the loopback address on R1 (2026::111:1) is not able to ping the loopback address on DSW2 (2026::102:1). Use the supported commands to isolate the cause of this fault and answer the following question. What is the solution to the fault condition?  
**A.** Under the interface Loopback6 configuration enter the `ipv6 ospf 6 area 34` command.  
**B.** Under `ipv6 router ospf 6` configuration enter the `redistribute rip RIP_ZONE include-connected` command.  
**C.** Under the interface Serial0/0/0.34 configuration enter the `ipv6 ospf 6 area 34` command.  
**D.** Under the interface Tunnel34 configuration enter the `ipv6 ospf 6 area 34` command.  
**Answer: B**  
**Explanation:** As explained earlier, the problem is with route redistribution on R4 of not redistributing RIP routes into OSPF for IPV6.  
**Topic 21, Ticket 16: IPv6 Routing Issue 3**  
**Topology Overview (Actual Troubleshooting lab design is for below network design)-** Client Should have IP 10.2.1.3 -EIGRP 100 is running between switch DSW1 & DSW2 -OSPF (Process ID 1) is running between R1, R2, R3, R4 -Network of OSPF is redistributed in EIGRP -BGP 65001 is configured on R1 with Webserver cloud AS 65002 -HSRP is running between DSW1 & DSW2 Switches  
The company has created the test bed shown in the layer 2 and layer 3 topology exhibits. This network consists of four routers, two layer 3 switches and two layer 2 switches. In the IPv4 layer 3 topology, R1, R2, R3, and R4 are running OSPF with an OSPF process number 1. DSW1, DSW2 and R4 are running EIGRP with an AS of 10. Redistribution is enabled where necessary. R1 is running a BGP AS with a number of 65001. This AS has an eBGP connection to AS 65002 in the ISP's network. Because the company's address space is in the private range. R1 is also providing NAT translations between the inside (10.1.0.0/16 & 10.2.0.0/16) networks and outside (209.65.0.0/24) network. ASW1 and ASW2 are layer 2 switches. NTP is enabled on all devices with 209.65.200.226 serving as the master clock source. The client workstations receive their IP address and default gateway via R4's DHCP server. The default

gateway address of 10.2.1.254 is the IP address of HSRP group 10 which is running on DSW1 and DSW2. In the IPv6 layer 3 topology R1, R2, and R3 are running OSPFv3 with an OSPF process number 6. DSW1, DSW2 and R4 are running RIPng process name RIP\_ZONE. The two IPv6 routing domains, OSPF 6 and RIPng are connected via GRE tunnel running over the underlying IPv4 OSPF domain. Redistribution is enabled where necessary. Recently the implementation group has been using the test bed to do a 'proof-of-concept' on several implementations. This involved changing the configuration on one or more of the devices. You will be presented with a series of trouble tickets related to issues introduced during these configurations. Note: Although trouble tickets have many similar fault indications, each ticket has its own issue and solution. Each ticket has 3 sub questions that need to be answered & topology remains same. Question-1 Fault is found on which device, Question-2 Fault condition is related to, Question-3 What exact problem is seen & what needs to be done for solution
