**NEW QUESTION: 1** During non-peak hours, a Developer wants to minimize the execution time of a full Amazon DynamoDB table scan without affecting normal workloads. The workloads average half of the strongly consistent read capacity units during non-peak hours. How would the Developer optimize this scan?  
**A.** Use parallel scans while limiting the rate  
**B.** Increase read capacity units during the scan operation  
**C.** Use sequential scans  
**D.** Change consistency to eventually consistent during the scan operation  
**Answer: A**  
**Explanation:** Parallel scans would help improve the scan performance while using limit parameter the provisioned throughput consumed can be limited. Refer AWS documentation - DynamoDB Parallel Scan  
By default, the Scan operation processes data sequentially. DynamoDB returns data to the application in 1 MB increments, and an application performs additional operations to retrieve the next 1 MB of data. The larger the table or index being scanned, the more time it takes to complete. In addition, a sequential Scan might not always be able to fully utilize the provisioned read throughput capacity: Even though DynamoDB distributes a large table's data across multiple physical partitions, a Scan operation can only read one partition at a time. For this reason, the throughput of a Scan is constrained by the maximum throughput of a single partition. To address these issues, the Scan operation can logically divide a table or secondary index into multiple segments, with multiple application workers scanning the segments in parallel. Each worker can be a thread (in programming languages that support multithreading) or an operating system process. A parallel scan with a large number of workers can easily consume all of the provisioned throughput for the table or index being scanned. It is best to avoid such scans if the table or index is also incurring heavy read or write activity from other applications. To control the amount of data returned per request, use the Limit parameter. This can help prevent situations where one worker consumes all of the provisioned throughput, at the expense of all other workers.

**NEW QUESTION: 2** A. Option B  
**B.** Option A  
**C.** Option C  
**D.** Option D  
**Answer: C**  
**Explanation:** Elastic Load Balancing registers the user's load balancer with his EC2 instance using the associated IP address. When the instances are stopped and started back they will have a different IP address. Thus, they will not get registered with ELB unless the user manually registers them. If the instances are assigned the same Elastic IP after reboot they will automatically get registered with ELB.

**NEW QUESTION: 3** Your network contains an Active Directory domain named adatum.com. The domain contains a domain controller named DC1 that runs Windows Server 2012. On DC1, you open DNS Manager as shown in the exhibit. (Click the Exhibit button.) You need to change the zone type of the contoso.com zone from an Active Directory-integrated zone to a standard

primary zone. What should you do before you change the zone type?**A.** Change the Key Master.  
**B.** Modify the Key Signing Key (KSK).**C.** Modify the Zone Signing Key (ZSK).**D.** Unsign the zone.  
**Answer: D** Explanation: A. Lock icon indicating that it is currently signed with DNSSEC, zone must be unsigned B. An authentication key that corresponds to a private key used to sign a zone. C. The KSK is an authentication key that corresponds to a private key used to sign one or more other signing keys for a given zone. Typically, the private key corresponding to a KSK will sign a ZSK, which in turn has a corresponding private key that will sign other zone data. D.
