NEW QUESTION: 1Zone change on a FC switch will send the switch to send RSCN to the device in a Zone. Which fabric service is responsible for collecting the status of the fabric change information?**A.** Name Server**B.** Management Server**C.** Fabric Server**D.** Fabric Controller server
Answer: D

NEW QUESTION: 2What is used to protect programs from all unauthorized modification or executional interference?**A.** Abstraction**B.** Security labels**C.** A protection domain**D.** A security perimeter
Answer: C
Explanation:A protection domain consists of the execution and memory space assigned to each process. The purpose of establishing a protection domain is to protect programs from all unauthorized modification or executional interference. The security perimeter is the boundary that separates the Trusted Computing Base (TCB) from the remainder of the system. Security labels are assigned to resources to denote a type of classification. Abstraction is a way to protect resources in the fact that it involves viewing system components at a high level and ignoring its specific details, thus performing information hiding. NEW QUESTION: 3Which two options are characteristics of a fast reboot?**A.** A fast reboot can only be executed on the SPARC platform when theconfig/fastreboot_default property for the svc:/system/boot-config:default serviceis set to true.**B.** A fast reboot is the default on all platforms.**C.** A fast reboot uses an in-kernel boot loader to load the kernelinto memory.**D.** A fast reboot cannot be used after a system panic on the x86 platform.**E.** A fast reboot bypasses grub.
Answer: A,C
Explanation:C: To change the default behavior of the Fast Reboot feature on the SPARC platform, so that a fast reboot is automatically performed when the system reboots, see below. The following example shows how to set the property's value to true on the SPARC platform, so that a fast reboot is initiated by default:# svccfg -s "system/boot-config:default" setprop config/fastreboot_default=true # svcadm refresh svc:/system/boot-config:default**D:** Fast Reboot implements an in-kernel boot loader that loads the kernel into memory and then switches to that kernel. The firmware and boot loader processes are bypassed, which enables the system to reboot withinseconds. The Fast Reboot feature is managed by SMF and implemented through a boot configuration service, svc:/system/boot-config. The boot-config

service provides a means for setting or changing the default boot configuration parameters. When the `config/fastreboot_default` property is set to true, the system performs a fast reboot automatically, without the need to use the `reboot -f` command. This property's value is set to true on the x86 platform. For task-related information, including how to change the default behavior of Fast Reboot on the SPARC platform, see *Accelerating the Reboot Process on an x86 Based System*. Note: One new feature, called Fast Reboot, will allow the system to boot up without doing the routine set of hardware checks, a move that can make system boot times up to two-and-a-half times faster, Oracle claimed. This feature can be handy in that an administrator applying a patch or software update across thousands of Solaris deployments can reboot them all the more quickly.
