NEW QUESTION: 1 Tim is a network administrator of Acme inc. He is responsible for configuring the network devices. John the new security manager reviews the configuration of the Firewall configured by Tim and identifies an issue. This specific firewall is configured in failover mode with another firewall. A sniffer on a PC connected to the same switch as the firewalls can decipher the credentials, used by Tim while configuring the firewalls. Which of the following should be used by Tim to ensure that no one can eavesdrop on the communication? **A. SFTP B. SCP C. RSH D. SSH**
Answer: D
Explanation: The SSH protocol provides an encrypted terminal session to the remote firewalls. By encrypting the data, it prevents sniffing attacks using a protocol analyzer also called a sniffer. With more and more computers installed in networked environments, it often becomes necessary to access hosts from a remote location. This normally means that a user sends login and password strings for authentication purposes. As long as these strings are transmitted as plain text, they could be intercepted and misused to gain access to that user account without the authorized user even knowing about it. Apart from the fact that this would open all the user's files to an attacker, the illegal account could be used to obtain administrator or root access or to penetrate other systems. In the past, remote connections were established with telnet, which offers no guards against eavesdropping in the form of encryption or other security mechanisms. There are other unprotected communication channels, like the traditional FTP protocol and some remote copying programs. The SSH suite provides the necessary protection by encrypting the authentication strings (usually a login name and a password) and all the other data exchanged between the hosts. With SSH, the data flow could still be recorded by a third party, but the contents are encrypted and cannot be reverted to plain text unless the encryption key is known. So SSH enables secure communications over insecure networks such as the Internet. The following answers are incorrect: SCP and SFTP
The SCP protocol is a network protocol that supports file transfers. The SCP protocol, which runs on port 22, is based on the BSD RCP protocol which is tunneled through the Secure Shell (SSH) protocol to provide encryption and authentication. SCP might not even be considered a protocol itself, but merely a combination of RCP and SSH. The RCP protocol performs the file transfer and the SSH protocol performs authentication and encryption. SCP protects the authenticity and confidentiality of the data in transit. It hinders the ability for packet sniffers to extract usable information from the data packets. The SCP protocol has been superseded by the more comprehensive SFTP protocol, which is also based on SSH.
RSH
RSH allows a user to execute commands on a remote system without having to log in to the system. For example, RSH can be used to remotely examine the status of a number of access servers without connecting to each communication server, executing the command, and then disconnecting from the communication server. As described in the rlogin article, the rsh protocol is not secure for network use, because it sends unencrypted information over the network, among other things. Some implementations also authenticate by sending

unencrypted passwords over the network. rsh has largely been replaced by the very similar SSH (secure shell) program on untrusted networks like the internet. As an example of RSH use, the following executes the command `mkdir testdir` as user `remote user` on the computer `remote computer`: `rsh -l remote user remote computer "mkdir testdir"` After the command has finished RSH terminates. If no command is specified then rsh will log in on the remote system using `rlogin`. The following reference(s) were/was used to create this question:

NEW QUESTION: 2 Your multitenant container (CDB) contains two pluggable databases (PDB), HR_PDB and ACCOUNTS_PDB, both of which use the CDB tablespace. The temp file is called `temp01.tmp`. A user issues a query on a table on one of the PDBs and receives the following error: `ERROR at line 1:ORA-01565: error in identifying file`

`'/u01/app/oracle/oradata/CDB1/temp01.tmp'` `ORA-27037: unable to obtain file status` Identify two ways to rectify the error. **A.** Shutdown the database instance, restore and recover the temp file from the backup, and then open the database with `RESETLOGS`. **B.** Shut down the database instance and then restart the CDB and PDBs. **C.** Add a new temp file to the temporary tablespace and drop the temp file that that produced the error. **D.** Take the temporary tablespace offline, recover the missing temp file by applying redo logs, and then bring the temporary tablespace online. **E.** Shut down the database instance, restore the `temp01.tmp` file from the backup, and then restart the database. **Answer: B, C** Explanation:

Explanation/Reference: Explanation: * Because temp files cannot be backed up and because no redo is ever generated for them, RMAN never restores or recovers temp files. RMAN does track the names of temp files, but only so that it can automatically re-create them when needed. * If you use RMAN in a Data Guard environment, then RMAN transparently converts primary control files to standby control files and vice versa. RMAN automatically updates file names for data files, online redo logs, standby redo logs, and temp files when you issue `RESTORE` and `RECOVER`.

NEW QUESTION: 3 A client is receiving IV morphine 2 days after colorectal surgery. Which of the following observations indicate that he may be becoming drug dependent? **A.** He is asleep 30 minutes after receiving the IV morphine. **B.** He asks for pain medication although his blood pressure and pulse rate are normal. **C.** The client requests pain medicine every 4 hours. **D.** He is euphoric for about an hour after each injection. **Answer: D** Explanation: Explanation (A) Frequent requests for pain medication do not necessarily indicate drug dependence after complex surgeries such as colorectal surgery. (B) Sleeping after receiving IV morphine is not an unexpected effect because the pain is relieved. (C) A person may be in pain even with normal vital signs. (D) A subtle sign of drug dependency is the tendency for the person to appear more euphoric than relieved of pain.

NEW QUESTION: 4 On the following graphic, you will find layers of policies. What is a precedence of traffic inspection for the defined policies? **A.** A packet arrives at the gateway, it is checked against the rules in IPS policy layer and then it comes next to the Network policy layer and then after accepting the packet it passes to Threat Prevention layer. **B.** A packet arrives at the gateway, it is checked against the rules in the networks policy layer and then if implicit Drop Rule drops the packet, it comes next to IPS layer and then after accepting the packet it passes to Threat Prevention layer. **C.** A packet arrives at the gateway, it is checked against the rules in the networks policy layer and then if there is any rule which accepts the packet, it comes next to IPS layer and then after accepting the packet it passes to Threat Prevention layer. **D.** A packet arrives at the gateway, it is checked against the rules in the networks policy layer and then if there is any rule which accepts the packet, it comes next to Threat Prevention layer and then after accepting the packet it passes to IPS layer. **Answer: C** Explanation: Explanation To simplify Policy management, R80 organizes the policy into Policy Layers. A layer is a set of rules, or a Rule Base.

For example, when you upgrade to R80 from earlier versions: When the gateway matches a rule in a layer, it starts to evaluate the rules in the next layer. All layers are evaluated in parallel
