**NEW QUESTION: 2**Click on the image of the F connector, which is commonly used for connecting television signals.**Answer:** Explanation:Explanation: The F connector is a common means of connecting television signals. It is a type of coaxial RF connector commonly used for "over the air" terrestrial television, cable television, and universally for satellite television and cable modems, usually with RG-6/U cable or, in older installations, with RG-59/U cable. It was invented by Eric E.Winston in the early 1950s while working for Jerrold Electronics on their development of cable television. In the 1970s, it became commonplace on VHF television antenna connections, as coaxial cables replaced twin-lead, and later for UHF also. The F connector is inexpensive, yet has good 75  $\Omega$  impedance match up to 1 GHz and has usable bandwidth up to several GHz. One reason for its low cost is that it uses the solid conductor (center wire) of the specified types of coaxial cable as the pin of the male connector. This design is subject to the surface properties of the inner conductor (which must be solid wire) and is not corrosion resistant; hence, water proof versions are needed for outside use. The male connector body is typically crimped, or sometimes screwed, onto the exposed outer braid. Female connectors have a 3/8-32 UNEF thread (9.525mm diameter). Most male connectors have a matching threaded connecting ring, though push-on versions are also available. Push-on F connector ends provide poor shielding against airborne signals (e.g., a nearby TV transmitter will interfere with a CATV station).
