NEW QUESTION: 2 Which type of information does the DHCP snooping binding database contain?**A.** untrusted hosts with leased IP addresses**B.** untrusted hosts with available IP addresses**C.** trusted hosts with available IP addresses**D.** trusted hosts with leased IP addresses

Answer: A Explanation: DHCP snooping is a security feature that acts like a firewall between untrusted hosts and trusted DHCP servers. The DHCP snooping feature performs the following activities: Validates DHCP messages received from untrusted sources and filters out invalid messages. Rate-limits DHCP traffic from trusted and untrusted sources. Builds and maintains the DHCP snooping binding database, which contains information about untrusted hosts with leased IP addresses. Utilizes the DHCP snooping binding database to validate subsequent requests from untrusted hosts. Reference:

NEW QUESTION: 3 Which of the following expansion slots can be used to plug a SCSI adapter? Each correct answer represents a complete solution. Choose all that apply.**A.** PC**B.** EISA**C.** VESA**D.** Slot 2**E.** Slot 1

Answer: A,B,C Explanation: Small Computer System Interface (SCSI) adapters can fit on PCI, EISA, and VESA slots. Unlike IDE, SCSI interface is generally not built-in on the motherboard. However, some motherboards do come with integrated SCSI adapters. In most cases, you have to purchase a SCSI adapter and install it into a bus slot. Once the SCSI adapter is installed, you can connect the SCSI devices to the host adapter. What is SCSI? Small Computer System Interface (SCSI) is the second most popular drive interface in use today after the Integrated Drive Electronics (IDE) interface. SCSI is faster than IDE and supports more devices. SCSI devices, such as hard disk drive and CD-ROM drive, are better suited in a network environment in which many users access shared drives simultaneously. SCSI has three standards. SCSI-1, SCSI-2, and SCSI-3. What is a VESA bus? VESA is an expansion bus standard developed by Video Electronics Standards Association to provide high-performance video and graphics capabilities. What is a PCI bus? Peripheral Component Interconnect (PCI) is a high-performance, 32-bit or 64-bit bus designed to be used with devices that have high bandwidth requirements, such as the display subsystem. What is an EISA bus? Extended Industry Standard Architecture (EISA) is a 32-bit PC expansion bus designed as a superset of a 16-bit ISA bus. The EISA bus is designed to increase the speed and expand the data width of the legacy expansion bus while still supporting older ISA cards. This is accomplished by providing the slot with two layers of connectors. The top layer is identical to a 16-bit ISA slot. The bottom layer is used by an EISA device but ignored by an ISA device. Therefore, both ISA and EISA

devices can work in an EISA slot. Answer options B and D are incorrect. Slot1 and Slot2 are used for Pentium III processors and Pentium Xeon processors, respectively.
