**NEW QUESTION: 1**Your network contains an Active Directory domain named adatum.com. The domain contains a file server named Server2 that runs Windows Server 2012. Server2 contains a shared folder named Home. Home contains the home folder of each user. All users have the necessary permissions to access only their home folder. A user named User1 opens the Home share as shown in the exhibit. (Click the Exhibit button.) You need to ensure that all users see only their own home folder when they access Home. What should you do from Server2?  
**A.** From Server Manager, modify the properties of Home.  
**B.** From Windows Explorer, modify the properties of Home.  
**C.** From Server Manager, modify the properties of the volume that contains Home.  
**D.** From Windows Explorer, modify the properties of the volume that contains Home.

**Answer: A** Explanation: Access-based Enumeration is a new feature included with Windows Server 2003 Service Pack 1. This feature allows users of Windows Server 2003-based file servers to list only the files and folders to which they have access when browsing content on the file server. This eliminates user confusion that can be caused when users connect to a file server and encounter a large number of files and folders that they cannot access. Access-based Enumeration filters the list of available files and folders on a server to include only those that the requesting user has access to. This change is important because this allows users to see only those files and directories that they have access to and nothing else. This mitigates the scenario where unauthorized users might otherwise be able to see the contents of a directory even though they don't have access to it. Access-Based Enumeration (ABE) can be enabled at the Share properties through Server Manager. After implementation instead of seeing all folder including the ones the user does not have access to: User will have access just to the folder where has rights to: If a user with full access browses the same folder - it will show all 5230 folders. <http://technet.microsoft.com/en-us/library/cc784710%28v=ws.10%29.aspx>

**NEW QUESTION: 2**Note This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series. Start of Repeated Scenario: Your network contains an Active Directory domain named contoso.com. The functional level of the forest and the domain is Windows Server 2008 R2. All servers in the domain run Windows Server 2016 Standard. The domain contains 300 client computers that run either Windows 8.1 or Windows 10. The domain contains nine servers that are configured as shown in the following table. The virtual machines are configured as follows: \* Each virtual machine has one virtual network adapter \* VM1 and VM2 are part of a Network Load Balancing (NLB) cluster. \* All of the servers on the network can communicate with all of the virtual machines. End of repeated Scenario. On server4, you plan to provision a new volume that will be used to create large, fixed-size VHDX files. Which type of file system should you use the new volume to minimize the amount of time required to create the

VHDX files? **A.** CVFS **B.** ReFS **C.** NTFS **D.** exFAT **Answer: B**

**NEW QUESTION: 3A.** Option D **B.** Option C **C.** Option A **D.** Option B **Answer: C**
