NEW QUESTION: 2 You have three servers that run Windows Server 2016. The servers are connected as shown in the exhibit. On all the servers, Windows Firewall is configured to allow ping traffic. You start Routing and Remote Access Service (RRAS) on Server2. You need to identify which IP addresses you can ping successfully from Server1 and Server3. What should you identify? To answer, select the appropriate options in the answer area. **Answer:** Explanation:

NEW QUESTION: 3 Your network contains an Active Directory forest named contoso.com. The forest contains a single domain. The domain contains two domain controllers named DC1 and DC2 that run Windows Server 2012 R2. The domain contains a user named User1 and a global security group named Group1. You need to prevent User1 from changing his password. The solution must minimize administrative effort. Which cmdlet should you run? **A.** Add-AdPrincipalGroupMembership **B.** Set-AdGroup **C.** Set-User **D.** Set-AdAccountControl **E.** Install-WindowsFeature **F.** Rename-AdObject **G.** Install-AddsDomain **H.** Install-AddsDomainController **Answer: D** Explanation: The Set-ADAccountControl cmdlet

modifies the user account control (UAC) values for an Active Directory user or computer account. UAC values are represented by cmdlet parameters. CannotChangePasswordModifies the ability of an account to change its password. To disallow password change by the account set this to \$true.. This parameter changes the Boolean value of the CannotChangePassword property of an account. The following example shows how to specify the PasswordCannotChange parameter. -CannotChangePassword \$falseReferences:

NEW QUESTION: 4An administrator has to determine host operating systems on the network and has deployed a transparent proxy. Which of the following fingerprint types would this solution use?
A. Packet
B. Port
C. Passive
D. Active
Answer: C
Explanation: Section: Threats and Vulnerabilities
Explanation/Reference: Explanation: TCP/IP stack fingerprinting is the passive collection of configuration attributes from a remote device during standard layer 4 network communications. The combination of parameters may then be used to infer the remote machine's operating system (aka, OS fingerprinting), or incorporated into a device fingerprint. Certain parameters within the TCP protocol definition are left up to the implementation. Different operating systems and different versions of the same operating system set different defaults for these values. By collecting and examining these values, one may differentiate among various operating systems, and implementations of TCP/IP. Just inspecting the Initial TTL and window size TCP/IP fields is often enough in order to successfully identify an operating system, which eases the task of performing manual OS fingerprinting. Passive OS fingerprinting is the examination of a passively collected sample of packets from a host in order to determine its operating system platform. It is called passive because it doesn't involve communicating with the host being examined. In this question, the proxy will use passive fingerprinting because the proxy is a 'transparent proxy'. It isn't seen by the computer.
