**NEW QUESTION: 1**What is the principle function of the data center core layer?**A.** services layer **B.** QoS marking**C.** repeater**D.** access control**E.** firewalling and intrusion prevention**F.** high-speed packet switching**Answer: F**

**NEW QUESTION: 2**Which Terraform command will check and report errors within modules, attribute names, and value types to make sure they are syntactically valid and internally consistent?**A.** terraform show**B.** terraform validate**C.** terraform fmt**D.** terraform format**Answer: B**  
**Explanation:**ExplanationThe terraform validate command validates the configuration files in a directory, referring only to the configuration and not accessing any remote services such as remote state, provider APIs, etc.Validate runs checks that verify whether a configuration is syntactically valid and internally consistent, regardless of any provided variables or existing state. It is thus primarily useful for general verification of reusable modules, including the correctness of attribute names and value types.It is safe to run this command automatically, for example as a post-save check in a text editor or as a test step for a re-usable module in a CI system.

**NEW QUESTION: 3**Which is the best definition of a JavaScript instance?**A.** An example of a field in a database**B.** A time-limited set of values taken from a database**C.** A static representation of real-time data**D.** An example of an object**Answer: D**
