Answer: A, B Explanation: Claims in access tokens JWTs (JSON Web Tokens) are split into three pieces:

* Header - Provides information about how to validate the token including information about the type of token and how it was signed.

* Payload - Contains all of the important data about the user or app that is attempting to call your service.

* Signature - Is the raw material used to validate the token. Your client can get an access token from either the v1.0 endpoint or the v2.0 endpoint using a variety of protocols.

Scenario: User authentication (see step 5 below)

The following steps detail the user authentication process:

* The user selects Sign in in the website.

* The browser redirects the user to the Azure Active Directory (Azure AD) sign in page.

The user signs in.

* Azure AD redirects the user's session back to the web application. The URL includes an access token.

* The web application calls an API and includes the access token in the authentication header. The application ID is sent as the audience ('aud') claim in the access token.

* The back-end API validates the access token. Reference:
