NEW QUESTION: 3A scope has been handed to you to set up a super fast gaming server and you decide that you will use Amazon DynamoDB as your database. For efficient access to data in a table, Amazon DynamoDB creates and maintains indexes for the primary key attributes. A secondary index is a data structure that contains a subset of attributes from a table, along with an alternate key to support Query operations. How many types of secondary indexes does DynamoDB support?**A.** 0**B.** 1**C.** As many as you need.**D.** 2**Answer: B**Explanation:DynamoDB supports two types of secondary indexes:Local secondary index - an index that has the same hash key as the table, but a different range key. A local secondary index is "local" in the sense that every partition of a local secondary index is scoped to a table partition that has the same hash key.Global secondary index - an index with a hash and range key that can be different from those on the table.A global secondary index is considered "global" because queries on the index can span all of the data in a table, across all partitions.Reference:
