NEW QUESTION: 1 オンプレミスサーバーからAmazon Elastic File

System (EFS) にアクセスするには、マウントターゲットセキュリティグループに追加する必要があるルールは次のうちどれですか？ **A.** オンプレミスサーバーからNetwork File

System (NFS) ポート (2049) への受信トラフィックを許可します。 **B.**

トラフィックをルーティングするために、Amazon

EFSとオンプレミスサーバーの間にNFSプロキシを構成します。 **C.**

オンプレミスサーバーからKerberosポート88への安全なトラフィックを許可します。 **D.**

ポイントツーポイントトンネリングプロトコルサーバー (PPTP) をセットアップして、安全な接続を許可します。 **Answer: A**

Explanation: By mounting an Amazon EFS file system on an on-premises server, on-premises data can be migrated into the AWS Cloud. Any one of the mount targets in your VPC can be used as long as the subnet of the mount target is reachable by using the AWS Direct Connect connection. To access Amazon EFS from an on-premises server, a rule must be added to the mount target security group to allow inbound traffic to the NFS port (2049) from the on-premises server.

Use of which of the following provides the easiest way to comply with this requirement? **A.** Multiple Availability Zone read replica **B.** Cross-region snapshot copy **C.** Multiple Availability Zone

snapshot copy **D**. Cross-region read replica **Answer: B**

NEW QUESTION: 3 How is Ethernet II different from Ethernet 802.3? **A**. Ethernet II and Ethernet 802.3 are two different names for the same protocol. **B**. Ethernet II identifies its payload type where as 802.3 indicates the frame length. **C**. Ethernet II can be used on broadcast networks where as 802.3 was designed for point-to-point networks. **D**. Ethernet II identifies its frame length while 802.3 indicates the payload type. **Answer: B**

NEW QUESTION: 4 You want to prioritize the video streaming traffic over the HTTP server traffic. Which attribute can be used to identify the streaming video flow? **A**. the Differentiated Service Field **B**. the Application Port Number **C**. IP address and TCP port **D**. the NIC Transmit and Receive Ring **Answer: A**

Explanation: * DiffServ uses the 6-bit Differentiated services Field (DS field) in the IP header for packet classification purposes. * In the Diffserv model, the marker marks a packet with a value that reflects a forwarding behavior. Marking is the process of placing a value in the packet's header to indicate how to forward the packet to the network. IPQoS contains two marker modules: / dscpmk - Marks the DS field in an IP packet header with a numeric value that is called the Differentiated Services codepoint, or DSCP. A Diffserv-aware router can then use the DS codepoint to apply the appropriate forwarding behavior to the packet. / dlcosmk - Marks the virtual local area network (VLAN) tag of an Ethernet frame header with a numeric value that is called the user priority. The user priority indicates the class of service (CoS), which defines the appropriate forwarding behavior to be applied to the datagram. Note: * Differentiated services or DiffServ is a computer networking architecture that specifies a simple, scalable and coarse-grained mechanism for classifying and managing network traffic and providing quality of service (QoS) on modern IP networks. DiffServ can, for example, be used to provide low-latency to critical network traffic such as voice or streaming media while providing simple best-effort service to non-critical services such as web traffic or file transfers. * IPQoS, included in Solaris, includes the following modules, which are part of the Differentiated Services (Diffserv) architecture that is defined in RFC 2475: Classifier Meter Marker IPQoS adds the following enhancements to the Diffserv model: Flow-accounting module 802.1D datagram marker
